Correct Answer:

References:

<https://azure.microsoft.com/en-us/support/plans/> **Tonyburg** Highly Voted 1 year, 11 months ago

So the answer would be this one? Can anyone confirm?

Basic

DEVELOPER

STANDARD

PROFESSIONAL DIRECT

upvoted 181 times

 **Duke_Lew** 1 year, 9 months ago

Should be correct as Basic > Developer > Standard > Professional Direct. As Premier is now only supported for the existing users until 1st July 2022, but not for new users, this question shows that you are a new user.

As of July 1, 2021, Microsoft will no longer enter into Premier Support agreements for new customers. Beginning July 1, 2022, Microsoft will no longer offer Premier Support agreements for renewing customers.

  **Self_Study** 2 months, 3 weeks ago

Did my exam with 925/1000 today. Only half was from the free part here. Focus on what data traffic is (not) charged (inbound, outbound etc.), what you can use to set up a resource lock that has been deleted (blueprints) or to the layers consisting of physical security, IAM, perimetr, network, data etc. or Azure China. Questions of correct Azure plans were not in my exam.

upvoted 2 times

  **sz91gabi** 2 months, 3 weeks ago

Guys,

Are the support ticket and support request not the same?

The table shows that it is possible to open as many support tickets within the base as the client needs.

Is analyzing and learning all free-access questions still enough to pass the exam in 2023?

upvoted 2 times

Question #2

Topic 1

Your company has datacenters in Los Angeles and New York. The company has a Microsoft Azure subscription.

You are configuring the two datacenters as geo-clustered sites for site resiliency.

You need to recommend an Azure storage redundancy option.

You have the following data storage requirements:

- ☞ Data must be stored on multiple nodes.
- ☞ Data must be stored on nodes in separate geographic locations.
- ☞ Data can be read from the secondary location as well as from the primary location

Which of the following Azure stored redundancy options should you recommend?

- A. Geo-redundant storage
- B. Read-only geo-redundant storage
- C. Zone-redundant storage
- D. Locally redundant storage

Correct Answer: B

RA-GRS allows you to have higher read availability for your storage account by providing “read only” access to the data replicated to the secondary location. Once you enable this feature, the secondary location may be used to achieve higher availability in the event the data is not available in the primary region. This is an “opt-in” feature which requires the storage account be geo-replicated.

References:

<https://docs.microsoft.com/en-us/azure/storage/common/storage-redundancy> <https://docs.microsoft.com/en-us/azure/storage/common/storage-redundancy-grs#read-access-geo-redundant-storage>

Community vote distribution

BinuRaj Highly Voted 2 years, 2 months ago

Answer is correct.

Geo-redundant storage (with GRS or GZRS) replicates your data to another physical location in the secondary region to protect against regional outages. However, that data is available to be read only if the customer or Microsoft initiates a failover from the primary to secondary region. When you enable read access to the secondary region, your data is available to be read at all times, including in a situation where the primary region becomes unavailable. For read access to the secondary region, enable read-access geo-redundant storage (RA-GRS) or read-access geo-zone-redundant storage (RA-GZRS).

upvoted 83 times

scab Highly Voted 2 years, 2 months ago

I think it 's a mistake, it should be "B. Read-access geo-redundant storage" instead of "B. Read-only geo-redundant storage"

upvoted 49 times

IT_Worldwide 4 months ago

This is correct. It should be "Read-access" and not "Read-only".

Official documentation: <https://learn.microsoft.com/en-us/azure/storage/common/storage-redundancy#redundancy-in-a-secondary-region>

upvoted 4 times

SAFM Most Recent 1 day, 20 hours ago

Answer B is correct:

"Geo-redundant storage (with GRS or GZRS) replicates your data to another physical location in the secondary region to protect against regional outages. However, that data is available to be read only if the customer or Microsoft initiates a failover from the primary to secondary region. However, if you enable read access to the secondary region, your data is always available, even when the primary region is running optimally. For read access to the secondary region, enable read-access geo-redundant storage (RA-GRS) or read-access geo-zone-redundant storage (RA-GZRS)." <https://learn.microsoft.com/en-us/training/modules/describe-azure-storage-services/3-redundancy>

upvoted 1 times

AntonioTech 3 weeks, 3 days ago

Selected Answer: A

Given the data storage requirements you've provided, the most suitable Azure storage redundancy option would be:

- A. Geo-redundant storage

Geo-redundant storage replicates your data to a secondary region, which is a separate geographic location. This meets the requirement of storing data on nodes in separate geographic locations. Additionally, geo-redundant storage allows you to read data from both the primary and secondary locations, which satisfies the requirement of being able to read data from the secondary location as well.

The other options:

- B. Read-only geo-redundant storage: While this option provides read access to the secondary location, it doesn't store data on nodes in separate geographic locations.
- C. Zone-redundant storage: This option replicates data within a single region across multiple Availability Zones, but it doesn't meet the requirement of storing data in separate geographic locations.
- D. Locally redundant storage: This option replicates data within a single datacenter in a region, which doesn't fulfill the requirement of storing data on nodes in separate geographic locations.

So, the recommended option is A. Geo-redundant storage.

upvoted 6 times

  **guru_ji** 1 month, 3 weeks ago

Selected Answer: B

the answer is B.

upvoted 2 times

  **Soumyat85** 2 months, 1 week ago

The correct answer is - A. Geo-redundant storage
Geo-redundant storage meets all the specified requirements. With geo-redundant storage, data is stored on multiple nodes located in separate geographic locations. It provides redundancy across regions, ensuring high availability and data durability. In addition, data can be read from both the primary and secondary locations, allowing for access to the data even if one location becomes unavailable.

B. Read-only geo-redundant storage does not fulfill the requirement that data can be written to and read from both the primary and secondary locations.

C. Zone-redundant storage is designed for redundancy within a single Azure region, and it does not satisfy the requirement for geographic separation.

D. Locally redundant storage does not meet the requirement of storing data on nodes in separate geographic locations.

upvoted 5 times

  **RVAadmin** 2 months, 2 weeks ago

The difference between GRS and RA GRS is fairly simple, GRS only allows to be read in the secondary zone in the even of a failover from the primary to secondary while RA GRS allows the option to read in the secondary whenever

upvoted 1 times

  **mariza21** 2 months, 2 weeks ago

Selected Answer: A

The correct answer is A. There is no such thing as "Read-Only geo-redundant storage".

Four aspects of the redundancy configuration of a storage account determine how your data is replicated and accessible:

- 1) Local redundancy - your data is always replicated three times within the local or primary region (LRS)
- 2) Zone redundancy - whether your data is replicated between different zones within the primary region (LRS vs. ZRS)
- 3) Geo-redundancy - replication within a single "local" region or between a primary and a secondary region (LRS vs. GRS)
- 4) Read access (RA) - read access to the secondary region when geo-redundancy is used (GRS vs. RA-GRS)

The reason you'd pick GRS is because your data is written to your primary node and then replicated to the secondary node. Thus, the system does "write" to both even if the user only writes to one.

upvoted 3 times

  **msmt** 2 months, 3 weeks ago

With GRS or GZRS, the data in the secondary region isn't available for read or write access unless there's a failover to the primary region. For read access to the secondary region, configure your storage account to use read-access geo-redundant storage (RA-GRS) or read-access geo-zone-redundant storage (RA-GZRS).

answer: B

upvoted 1 times

  **taianmendes** 3 months ago

Selected Answer: B

simples

upvoted 1 times

  **ShantanuDutta** 3 months ago

Selected Answer: B

The difference between GRS and RA GRS is, GRS only allows to be read in the secondary zone in the even of a failover from the primary to secondary while RA GRS allows the option to read in the secondary whenever.

In this question, it says read data from secondary whenever it needs. not only failover case. So answer will be B

I thinks B is corrected

upvoted 1 times

  **PirateKingKumar** 3 months, 2 weeks ago

correct answer is B but it should be named as "read-access geo-redundant storage".

upvoted 1 times

  **petebear55** 3 months, 2 weeks ago

came up on my exam last week .. which i failed by one question : How many copies of data are maintained by Azure?
three times

Data in an Azure Storage account is always replicated three times in the primary region. Azure Storage offers two options for how your data is replicated in the primary region: Locally redundant storage (LRS) copies your data synchronously three times within a single physical location in the primary region.

Question #3

Topic 1

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result.
Establish if the solution satisfies the requirements.

Your company's Azure subscription includes a Basic support plan.

They would like to request an assessment of an Azure environment's design from Microsoft. This is, however, not supported by the existing plan.

You want to make sure that the company subscribes to a support plan that allows this functionality, while keeping expenses to a minimum.

Solution: You recommend that the company subscribes to the Professional Direct support plan.

Does the solution meet the goal?

A. Yes

B. No

Correct Answer: B

"while keeping expenses to a minimum". That is the point. So a std plan would suffice.
upvoted 51 times
- Adediwura

1 year, 11 months ago

I think you are mistaking. The catch to the question is keeping expenses to a minimum. The service they require is an on-premise inspection. If you opt for the standard plan you won't get such service. So that is money wasted since Microsoft as stated in their docs won't refund your money even if you cancel and already purchased support. And now you have to purchase support for the right plan this Money spent twice.

upvoted 1 times

  **chaoziranli** 1 month, 3 weeks ago

The Professional Direct support plan does not include design assessments of Azure environments. Instead, the company should subscribe to the Azure Expert Managed Services Provider (MSP) program, which offers design assessments of Azure environments as part of its services.

upvoted 1 times

  **nonox** 2 months, 1 week ago

Selected Answer: B

<https://azure.microsoft.com/en-us/support/plans/>
Professional direct is the most expensive one.

upvoted 2 times

  **Soumyat85** 2 months, 1 week ago

B. No
The solution does not meet the goal of keeping expenses to a minimum. The Professional Direct support plan is a higher-tier support plan that incurs additional costs compared to the Basic support plan. While the Professional Direct support plan does provide access to design assessments from Microsoft, it may not be the most cost-effective option for the company. It would be more appropriate to recommend a support plan that includes design assessments but still keeps expenses low, such as the Developer or Standard support plans.

upvoted 3 times

  **Londoner** 2 months, 2 weeks ago

Assessment of Azure environment's design can be done by both professional and standard support plans.
Priority response and 24/7 support is only available on Professional Direct.
Professional Direct Price is 1000/month and Standard is 100/month both in US Dollars.
There is two part to the question and if both are true then the goal is met. If only one is met then the goal is not met.
Part 1 environment design assessment is satisfied by Professional Direct OR Standard.
Part 2 is keeping costs down is satisfied by only the Standard Plan based on the information given (ie no information about priority response or 24/7 support).
Goal of keeping costs down is not met. Answer B.

upvoted 3 times

  **rmzn** 2 months, 2 weeks ago

2 years, 2 months ago

Platform as a service refers to cloud computing services that supply an on-demand environment for developing, testing, delivering, and managing software applications. PaaS is designed to make it easier for developers to quickly create web or mobile apps, without worrying about setting up or managing the underlying infrastructure of servers, storage, network, and databases needed for development.

The answer is B. No

Deploying Azure virtual machines requires more control over the infrastructure and configuration than what is typically offered by Platform as a Service (PaaS). Platform as a Service (PaaS) provides a platform and environment for developers to build, deploy, and manage applications without managing the underlying infrastructure, but it doesn't give you the level of control needed for deploying and managing virtual machines. Therefore, the solution of using Platform as a Service (PaaS) does not meet the goal for deploying Azure virtual machines.
upvoted 1 times
- Soumyat85

2 months, 1 week ago

B. No
The solution does not meet the goal. Platform as a Service (PaaS) is a cloud computing model where a third-party provider manages the underlying infrastructure and provides a platform for building and deploying applications. With PaaS, you typically don't have direct control over the virtual machines themselves.
In this scenario, the goal is to deploy Azure virtual machines, which is an Infrastructure as a Service (IaaS) offering. With IaaS, you have more control over the virtual machines and can directly manage and configure them. Therefore, the appropriate cloud deployment solution in this case would be Infrastructure as a Service (IaaS), not Platform as a Service (PaaS).

correct answer. Virtual Machines and Azure storage accounts is IaaS

upvoted 1 times
- AntonioTech

3 weeks, 3 days ago

The answer is A. Yes

Using Infrastructure as a Service (IaaS) is the appropriate solution for deploying Azure virtual machines. IaaS provides you with the flexibility to create, manage, and configure virtual machines in the cloud while still maintaining control over the underlying infrastructure, including operating systems, networking, and storage. This option aligns with the goal of deploying Azure virtual machines for your company.

Question #7

Topic 1

Your developers have created 10 web applications that must be host on Azure.

You need to determine which Azure web tier plan to host the web apps. The web tier plan must meet the following requirements:

- ☞ The web apps will use custom domains.
- ☞ The web apps each require 10 GB of storage.
- ☞ The web apps must each run in dedicated compute instances.
- ☞ Load balancing between instances must be included.
- ☞ Costs must be minimized.

Which web tier plan should you use?

- A. Standard
- B. Basic
- C. Free
- D. Shared

Correct Answer: B

Standard offers 50 GB of storage space, while Basic only gives 10 GB.

References:

<http://azure.microsoft.com/en-us/pricing/details/websites/>

Community vote distribution

🗨️ **BinuRaj** Highly Voted 2 years, 2 months ago

Please read the requirements: Many are not noting here the load balancing fact.

The web apps will use custom domains. (Basic, Shared and standard Support custom domain)

The web apps each require 10 GB of storage. (basic and standard support this)

The web apps must each run in dedicated compute instances.(basic support 3 instance max where standard support 10max)

Load balancing between instances must be included. (free, shared and basic dont support load balancing. standard and above tier only support load balancing/autosacling)

Costs must be minimized. Standard is less costier than premium and isolated. I hope this is clear to chose the correct answer as STANDARD.

<https://azure.microsoft.com/en-us/pricing/details/app-service/windows/>

upvoted 344 times

🗨️ **IESH** 12 months ago

in the given link by you, when I was browsing through to the below section under the heading of "Basic Service Plan" it says "Built-in network load balancing support automatically distributes traffic across instances." with this explanation, should we not consider the answer as BASIC?

upvoted 17 times

🗨️ **JulienD** 11 months, 1 week ago

The number of instance needed ? In BASIC plan you have only 3 instances, while in the STANDARD plan you have 10 instances.

You right on the load balancing point, it's seems BASIC plan also have load balancing

upvoted 8 times

🗨️ **marerad** 10 months, 3 weeks ago

Definitely STANDARD due to instances.

upvoted 10 times

🗨️ **Benzitho** 8 months, 2 weeks ago

"Basic, Standard and Premium plans are for production workloads and run on dedicated Virtual Machine instances. Each instance can support multiple applications and domains " This makes Basic the correct answer. Default Basic supports Load balancing. ... Each instance can support multiple applications and domains ...which makes Basic the correct answer even though it supports only 3 instances ..

upvoted 4 times

🗨️ **dcaso** 10 months, 2 weeks ago

You are wrong, is Basic.

From question "Your developers have created 10 web applications that must be host on Azure."

And if you take a look at <https://azure.microsoft.com/en-us/pricing/details/app-service/windows/>, you can see "Run production workloads" not "Run different apps", here you must buy 10 App services, here is the trick.

upvoted 21 times

🗨️ **peymani** 1 year, 9 months ago

The web apps each require 10 GB of storage. it said each so 10 apps each 10GB = 100 GB

the correct answer should be Premium Enhanced performance and scale. However, it is not there and the best option should be Standard.

upvoted 17 times

  **soze** 6 months, 2 weeks ago

Yes, you're right, and we also need to consider the number of instances. The Basic service plan supports only a maximum of three instances, while the Standard service plan supports a maximum of 10 instances.

upvoted 2 times

  **Esward** 12 months ago

perfect STANDARD is the correct answer

upvoted 4 times

  **mahmoud_az** Highly Voted 2 years, 2 months ago

the Answer is Standard :

Standard tier support Custom Domains, Disk Space of 50GB wich is more than enough for the requested plan, and as long as they want to run each web app in a dedicated instance, that means we need 10 dedicated instances for the 10 web apps with a load-balancing service between them, the basic plan only support up to 3 dedicated instances.

Finally the Standard plan has the lowest cost compared to Premuim and Isolated pricing tiers.

upvoted 70 times

  **DartTrapdoor** 2 years, 2 months ago

Ten services need 10GB each whic his 100GB. I don't htink Standard is enough, I don't think any of the provided answers fit.

upvoted 10 times

  **hkmomin** 2 years, 2 months ago

It's confusing for sure but if I scroll down on the link and see under "Standard Service Plan" they have 50GB per instance. Example has 3 instance therefore 150 GB in total, based on that Standard should support.

STANDARD: 10GB each VM, and the VMs have to run on dedicated instances. Writing exam today.

upvoted 2 times

  **Irshad2306** 2 weeks, 3 days ago

Correct Ans is --> Standard Plan

Because-

1.Both the Azure Basic and Standard plans offer 10 GB of web app storage. However, there are some key differences

2.The Azure Basic plan allows up to 3 instances of your web app to run at the same time, while the Azure Standard plan allows up to 10 instances.This means that you can handle more traffic with the Azure Standard plan.

upvoted 1 times

  **Sushant_02** 2 weeks, 3 days ago

Selected Answer: A

It says that there are 10 apps to be hosted and each app needs 10 GB for disk space. Which means we need 100 GB of disk space (10*10 GB), more over standard and above only supports load balancing/ auto scale, each app requires to run in its own instance which means 10 apps so 10 instance. again standard and above supports 10 more more than 10 instances. Basic has only 3. Hence clearly Basic cannot be the right answer. Standard is the closed correct answer as per the given options

upvoted 1 times

  **AntonioTech** 3 weeks, 3 days ago

The answer is A. Standard

The Standard web tier plan in Azure App Service provides dedicated compute instances, custom domains support, 10 GB of storage per app, and load balancing between instances. It fulfills all the specified requirements for hosting the web apps with custom domains, dedicated compute instances, required storage, and load balancing. While it's not the lowest-cost option (compared to Free, Basic, or Shared plans), it meets all the outlined requirements, including minimizing costs while still offering the necessary features.

upvoted 2 times

  **VinnyMacD** 1 month, 1 week ago

Your developers have created "10 web applications" that must be host on Azure.
must meet the following requirements:

☞ The web apps "each require 10 GB of storage."
10x10 = 100 GB of storage.

Standard offers only 50GB...but that's the closest answer. I think, the question has room for improvement.

upvoted 4 times

  **Soumyat85** 2 months, 1 week ago

A. Standard

The Standard web tier plan meets all the specified requirements. Here's how it aligns with each requirement:

Custom domains: The Standard plan allows you to use custom domains for your web apps.

Storage: The Standard plan includes 50 GB of storage, which exceeds the requirement of 10 GB per web app.

Dedicated compute instances: The Standard plan provides dedicated compute instances for each web app.

Load balancing: Load balancing between instances is included in the Standard plan, allowing for high availability and scalability.

Cost optimization: While the Standard plan incurs costs, it provides the necessary features and capabilities to meet the requirements of the web apps. Compared to other premium plans, it offers a balance between features and costs.

upvoted 1 times

  **rambabumandalapu** 1 month, 3 weeks ago

Each webapp requires 10 GB dedicated storage , so 10 webapps requires 100 GB space, STANDARD plan may not be sufficient.

upvoted 2 times

Question #8

Topic 1

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.

You are planning to migrate a company to Azure. Each of the company's numerous divisions will have an administrator in place to manage the Azure resources used by their respective division.

You want to make sure that the Azure deployment you employ allows for Azure to be segmented for the divisions, while keeping administrative effort to a minimum.

Solution: You plan to make use of several Azure Active Directory (Azure AD) directories.

Does the solution meet the goal?

- A. Yes
- B. No

Correct Answer: B

Community vote distribution

B (98%)

- Georgess

Highly Voted

1 year, 11 months ago

The proposed solution is: You plan to make use of several Azure Active Directory (Azure AD) directories. I think the key word is SEVERAL. Why in the world a company will create SEVERAL AADs when it can create a single AAD and organize its divisions right there? This is why I consider the correct answer B (No).
upvoted 113 times
- Chennings

Selected Answer: B

They can easily manage multiple admin access through administrative unit or management unit
upvoted 1 times
- AntonioTech

3 weeks, 3 days ago

The answer is B. No

Creating multiple Azure Active Directory (Azure AD) directories for each division is not the most suitable solution for achieving segmentation of Azure resources for divisions. While it's technically possible to have separate Azure AD directories for different divisions, this approach can lead to increased administrative complexity and additional management overhead. Managing multiple directories could require more effort and potentially result in a less cohesive and efficient setup.

A more suitable solution would involve using Azure RBAC (Role-Based Access Control) to assign appropriate permissions to administrators within a single Azure AD directory. This way, you can achieve the desired segmentation of resources while minimizing administrative effort. Each division's administrator can be assigned specific roles and permissions to manage their respective resources within the same Azure AD directory.
upvoted 1 times
- glazdub

1 month, 2 weeks ago

Selected Answer: B

Answer is B only one AAD is sufficient
upvoted 1 times
- Soumyat85

2 months, 1 week ago

B. No
The solution does not meet the goal. Creating several Azure Active Directory (Azure AD) directories would separate the Azure resources into different environments, but it would also increase administrative effort and complexity. Each Azure AD directory would require separate management and administration, leading to duplication of efforts and potential challenges in maintaining consistency across divisions. A more appropriate solution to meet the goal of segmenting Azure for divisions while minimizing administrative effort would be to use Azure RBAC (Role-Based Access Control) and resource groups. By leveraging Azure RBAC, you can assign division-specific administrators with appropriate

access permissions to manage the Azure resources within their respective resource groups. This approach allows for segregation of resources based on divisions while maintaining centralized management and reducing administrative overhead.

  **BeauChateau** 6 months, 3 weeks ago

Selected Answer: B

No, the solution does not meet the goal.

Using multiple Azure Active Directory (Azure AD) directories to segment Azure resources for each division may not be the most efficient way to manage the resources. While it does provide segregation of resources and administrative control, it can result in additional administrative effort for managing multiple directories.

A better solution would be to use Azure Resource Manager (ARM) to create separate resource groups for each division. Resource groups allow for segregation of resources, while still providing a single management interface. Each division can have an administrator assigned to their respective resource group, allowing them to manage the resources for their division.

Using Azure Resource Manager (ARM) to create separate resource groups for each division provides an efficient way to segment Azure resources while keeping administrative effort to a minimum. Therefore, the proposed solution of using multiple Azure AD directories does not meet the goal, and using Azure Resource Manager (ARM) to create separate resource groups should be used instead.

upvoted 15 times

  **suresh_fx** 6 months, 3 weeks ago

No, the solution does not meet the goal. Creating multiple Azure AD directories would result in administrative overhead and complexity, as each directory would need to be managed separately

The answer is A. Standard

The Standard web tier plan in Azure App Service meets the specified requirements:

Custom Domain (miami.veyland.com): The Standard plan allows you to use custom domains, so you can set up the miami.veyland.com URL for the website.

Two Instances: The Standard plan provides the ability to scale out to multiple instances, which fulfills the requirement to deploy the website to two instances.

SSL Support: The Standard plan includes SSL support, which is necessary for secure communication over HTTPS.

Storage (12 GB): The Standard plan includes sufficient storage for the 12 GB requirement.

Costs Minimization: While the Standard plan might not be the lowest-cost option compared to Free, Basic, or Shared plans, it provides the necessary features and capacity for the given requirements.

Given that the website will be publicly accessible, require SSL, need multiple instances, and have a custom domain, the Standard plan is the most appropriate choice that meets all the criteria.

upvoted 3 times

  **glazdub** 1 month, 2 weeks ago

Selected Answer: A

Basic offers max 10 GB disk space the next cheaper tier is Standard which offers all other features + 50 GB
upvoted 2 times

  **Eagrob_11** 3 months, 2 weeks ago

The answer is A. Here is some difference between Basic and Standard
1. Basic Tier: The Basic tier provides a cost-effective option for hosting small-scale web applications with fewer advanced features. It offers features such as manual scaling, limited auto-scaling, deployment slots, and basic monitoring. It is suitable for simple web apps with low traffic or development/testing environments.
2. Standard Tier: The Standard tier provides additional features and capabilities compared to the Basic tier. It includes features like advanced auto-scaling, traffic routing, deployment slots with testing in production, integration with Azure Application Insights for detailed monitoring, and support for custom domain SSL certificates. It is suitable for production-grade web applications with moderate to high traffic or those requiring more advanced functionality.

I can't seem to see anything about this question on the microsoft learning path for this exam. <https://learn.microsoft.com/en-us/certifications/azure-fundamentals/>
Can anyone confirm what section it's in please?
upvoted 2 times

  **SonyUnder** 3 months, 1 week ago

If you rely solely on Microsoft's Learning Roadmap on the Learn platform, you're screwed! How I'll get by. hehehe Unfortunately, I found these questions here just a few hours before taking the exam. Result: 685 points only. If I hadn't seen this here, I probably wouldn't have scored even 400 points.
upvoted 3 times

  **Michelle_YaNan** 3 months, 4 weeks ago

B. Basic

Explanation:

The Basic tier includes support for Unlimited SNI SSL connections, which fulfills the SSL support requirement for the web app.
The Basic tier also supports scaling to multiple instances, allowing you to deploy the web app to two nodes for increased availability and performance.
The Basic tier provides load balancer support, which can distribute incoming traffic across the instances for improved performance and reliability.
Each instance in the Basic tier can have up to 10 GB of storage, and since you require a total of 12 GB of storage, you can allocate 10 GB of storage to each of the two instances.
The Basic tier is cost-effective and suitable for small to medium-scale applications, helping to minimize costs while meeting the specified requirements.
Option A, Standard, is also a valid choice, but considering the cost optimization requirement, the Basic tier would be a more cost-effective solution while still meeting the necessary requirements for the web app.
upvoted 1 times

  **CyberP** 3 months ago

This is wrong, 10 GB is total for basic its not 30GB for 3 instances of course :D
Total disk space is 10 GB for basic so not enough. You should choose Standard.

- AntonioTech

Most Recent

3 weeks, 3 days ago

The answer is B. No

The term "elastic expenditure model" isn't a standard term or concept used in Azure or cloud computing. The two common expenditure models in Azure are "pay-as-you-go" and "reserved instances."

Pay-as-you-go: This is the default and most common expenditure model in Azure. It means you pay for resources you consume on an hourly or per-minute basis. It offers flexibility to scale resources up and down as needed.

Reserved Instances: This is an expenditure model where you commit to a one- or three-year term for a particular virtual machine instance type, size, and region. This commitment provides you with a discount compared to pay-as-you-go pricing.

Given the options, if you're migrating to a pay-as-you-go subscription, you're already aligning with the pay-as-you-go expenditure model. The term "elastic expenditure model" doesn't accurately represent an established concept in Azure, so the solution is not correct. The correct description for the chosen expenditure model would simply be "pay-as-you-go."

B. No
The solution does not meet the goal. There is no specific expenditure model called the "elastic expenditure model" in Azure. When migrating virtual machines to an Azure pay-as-you-go subscription, the appropriate expenditure model to consider is the "pay-as-you-go" or "consumption-based" model. This means that you will be billed based on the actual usage of Azure resources, such as virtual machines, storage, and networking, on an hourly or per-minute basis. Therefore, the correct solution would be to recommend the use of the "pay-as-you-go" expenditure model, not the "elastic expenditure model."

Answer is No.

Operating expenditures are ongoing costs of doing business. Consuming cloud services in a pay-as-you-go model could qualify as an operating expenditure.

upvoted 22 times
- AntonioTech

Most Recent

3 weeks, 3 days ago

The answer is B. No

The term "scalable expenditure model" still isn't a standard term in Azure or cloud computing. The common expenditure models in Azure are "pay-as-you-go" and "reserved instances."

Pay-as-you-go: This is the default and most common expenditure model in Azure. It means you pay for resources you consume on an hourly or per-minute basis. It offers flexibility to scale resources up and down as needed.

Reserved Instances: This is an expenditure model where you commit to a one- or three-year term for a particular virtual machine instance type, size, and region. This commitment provides you with a discount compared to pay-as-you-go pricing.

If you're migrating to a pay-as-you-go subscription, you're already aligning with the pay-as-you-go expenditure model. The term "scalable expenditure model" is not an accurate description of an established concept in Azure, so the solution is not correct. The appropriate description for the chosen expenditure model is "pay-as-you-go."

  **LuchoGonzalez** 6 months ago
Selected Answer: B
"scalable" is not related with CAPEX or OPEX model. It's about cloud computing
upvoted 3 times

  **BeauChateau** 6 months, 3 weeks ago
Selected Answer: B
B. No

The solution does not meet the goal.

"Scalable expenditure model" is not a valid expenditure model in Azure. The recommended expenditure model for the pay-as-you-go subscription is the Consumption model. The Consumption model allows for billing based on actual usage of Azure resources, such as virtual machines and storage, and provides the ability to monitor and manage costs through Azure cost management tools.

Therefore, the proposed solution of using the "scalable expenditure model" does not meet the goal, and the recommended expenditure model for the pay-as-you-go subscription is the Consumption model.

Pay -as-you-go---->Operational Expenditure Model.

upvoted 19 times
- SAFM

Most Recent

1 day, 19 hours ago

Most people say the answer is A. However, this sounds like a tricky question, because with Public Cloud computing you ONLY do Pay-as-you-go which is OpEx. There is no need to recommend OpEx over CapEx, because CapEx in the Cloud is not even included or available. However, if you are building a PRIVATE cloud model then you'll have to sustain some CapExs, but in that case, you cannot avoid them, so you cannot simply recommend OpEx over rCapEx. For me, the answer is No.

upvoted 1 times
- AntonioTech

3 weeks, 3 days ago

The answer is A. Yes

The term "operational expenditure (OpEx) model" aligns with the concept of a pay-as-you-go subscription in Azure. In an OpEx model, you pay for resources and services as you use them, typically on a recurring basis. This corresponds to the pay-as-you-go approach in Azure, where you pay for the resources you consume on an hourly or per-minute basis. This includes virtual machine usage, storage, networking, and other services.

Therefore, recommending the use of the operational expenditure (OpEx) model is appropriate and meets the goal of migrating to an Azure pay-as-you-go subscription.

Selected Answer: A

PAY AS U GO

upvoted 1 times
- Soumyat85

2 months, 1 week ago

A. Yes

The solution meets the goal. The operational expenditure (OpEx) model is the correct expenditure model for the scenario described. In the OpEx model, the company pays for the usage of Azure resources on a consumption basis, typically on a monthly or yearly basis. This aligns with the pay-as-you-go subscription in Azure, where costs are incurred based on actual resource usage.

By migrating the virtual machines to an Azure pay-as-you-go subscription, the company will be able to take advantage of the OpEx model, enabling them to have more flexibility and scalability in managing their infrastructure costs.

Selected Answer: A

There are 2 types of expenditure modele

Capital Expenditure (CAPEX)

Operational Expenditure (OPEX) is a pay-as-you-go model

upvoted 1 times
- BeauChateau

6 months, 3 weeks ago

Selected Answer: A

A. Yes

The solution meets the goal.

Azure offers two expenditure models for cloud computing: operational expenditure (OpEx) and capital expenditure (CapEx). The OpEx model allows you to pay for services or resources as you use them and treat those expenses as operational expenses, while the CapEx model requires you to pay upfront for resources as a capital expense.

In this scenario, the pay-as-you-go subscription is an OpEx model because it allows the company to pay for Azure resources as they use them, instead of paying upfront for resources as a CapEx model. Therefore, the recommended solution of using the operational expenditure model meets the goal.

Answer is NO.

Azure Cosmos DB is a fully managed NoSQL database for modern app development. Single-digit millisecond response times, and automatic and instant scalability, guarantee speed at any scale.
upvoted 57 times
- AntonioTech

Most Recent

3 weeks, 3 days ago

The answer is B. No

Azure Cosmos DB is a globally distributed, multi-model database service, and while it is a powerful solution for managing and querying data, it is not specifically designed for building, testing, and deploying predictive analytics models.

For building, testing, and deploying predictive analytics models, you would typically use machine learning services and platforms provided by Azure, such as Azure Machine Learning. Azure Machine Learning provides tools and services specifically designed for creating, training, testing, and deploying machine learning models, including predictive analytics models.

So, the solution of using Azure Cosmos DB does not meet the goal of building, testing, and deploying predictive analytics for the AI solution.
upvoted 3 times
- Molota

4 months ago

Selected Answer: B

Azure Cosmos DB isn't the solution
upvoted 2 times
- BeauChateau

6 months, 3 weeks ago

B. No

The solution does not meet the goal.

Azure Cosmos DB is a globally distributed, multi-model database service that can be used to store and retrieve data for various use cases. However, it is not specifically designed for building, testing, and deploying predictive analytics solutions.

To build, test, and deploy predictive analytics solutions in Azure, you should make use of Azure Machine Learning, which is a cloud-based service that provides a platform for building and deploying machine learning models. Azure Machine Learning supports a wide range of AI and machine learning scenarios, including predictive analytics. It provides a variety of tools and frameworks, including Jupyter notebooks, Python, R, and SQL, to help data scientists build, test, and deploy machine learning models.

Therefore, the recommended solution should be to use Azure Machine Learning instead of Azure Cosmos DB to meet the goal of building, testing, and deploying predictive analytics for the AI solution.

The answer is A. Yes

Syncing all the Active Directory user accounts to Azure Active Directory (Azure AD) is a common strategy to ensure a smooth migration to the cloud while minimizing the impact on users. This approach is often referred to as implementing a hybrid identity model.

By syncing the user accounts to Azure AD using tools like Azure AD Connect, users can continue using their existing credentials to access cloud resources after the migration. This provides a seamless experience for users and reduces the disruption typically associated with migrations.

Therefore, the solution of syncing Active Directory user accounts to Azure AD meets the goal of reducing the impact on users during the migration to Azure.

upvoted 3 times
- n00bofn00bs

3 months ago

Question #16

Topic 1

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.

Your company's infrastructure includes a number of business units that each need a large number of various Azure resources for everyday operation.

The resources required by each business unit are identical.

You are required to sanction a strategy to create Azure resources automatically.

Solution: You recommend that the Azure API Management service be included in the strategy.

Does the solution meet the goal?

- A. Yes
- B. No

Correct Answer: B

Community vote distribution

B (94%)

6%

- awsORbust

Highly Voted

2 years, 1 month ago

Answer is B - No. Azure API Management Service i(APIM) is a way to create and manage customer APIs for existing backend services. The Question is asking about a way to create Azure resources automatically (on the fly). ARM (Azure Resource Manager) is a tool that automates the deployments on the AZ cloud.

upvoted 195 times
- BinuRaj

Highly Voted

2 years, 2 months ago

Answer seems correct. It should be ARM template.
<https://docs.microsoft.com/en-us/azure/azure-resource-manager/templates/overview>

To meet these challenges, you can automate deployments and use the practice of infrastructure as code. In code, you define the infrastructure that needs to be deployed. The infrastructure code becomes part of your project. Just like application code, you store the infrastructure code in a source repository and version it. Any one on your team can run the code and deploy similar environments.

upvoted 64 times
- Mayurichavan

1 year, 10 months ago

but in solution they have given Azure API. so answer is no

upvoted 11 times
- AntonioTech

Most Recent

3 weeks, 3 days ago

The answer is B. No

Azure API Management is a service that helps you create consistent and modern API gateways for existing back-end services. While it's an essential tool for managing and securing APIs, it is not designed to automatically create various Azure resources for different business units.

To automatically create identical Azure resources for each business unit, you would typically use Azure Resource Manager (ARM) templates, Azure Policy, or Infrastructure as Code (IaC) tools like Azure Bicep or Terraform. These tools allow you to define and deploy your infrastructure as code, ensuring consistency and reproducibility.

So, the solution of using Azure API Management does not meet the goal of automatically creating Azure resources for each business unit.

Selected Answer: B

No, the solution does not meet the goal. Azure API Management is a service that helps in creating and publishing APIs to external and internal consumers. It is not designed to create and manage Azure resources automatically. To create Azure resources automatically, you can use Azure Resource Manager (ARM) templates or Azure Automation. These tools allow you to define your infrastructure as code and deploy it quickly and consistently.

Question #17

Topic 1

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.

Your company's infrastructure includes a number of business units that each need a large number of various Azure resources for everyday operation.

The resources required by each business unit are identical.

You are required to sanction a strategy to create Azure resources automatically.

Solution: You recommend that management groups be included in the strategy.

Does the solution meet the goal?

- A. Yes
- B. No

Correct Answer: B

Los grupos de gestión son una forma conveniente de aplicar políticas y control de acceso a los recursos, mas no para la creación de recursos.

Respuesta B

upvoted 1 times
- AntonioTech

3 weeks, 3 days ago

The answer seems to be A. Yes

Using Azure management groups can be an effective strategy for organizing and managing resources, especially when you have multiple business units that require identical Azure resources. Azure management groups provide a way to apply governance and policies across multiple subscriptions, making it easier to enforce consistent standards and configurations.

By creating management groups and associating subscriptions under those groups, you can define policies, access controls, and apply consistent naming conventions or tagging across all the resources used by each business unit. This can simplify resource deployment and management while ensuring that all business units follow the same guidelines.

So, recommending the use of management groups in the strategy can help meet the goal of automatically creating and managing Azure resources for each business unit.

upvoted 1 times
- SAFM

We can use Azure Resource Manager templates to automate the creation of the Azure resources. Deploying resource through templates is known as Infrastructure as code. To implement infrastructure as code for Azure solutions, use Azure Resource Manager templates.
upvoted 1 times

  **louloua** 3 months, 1 week ago
Answer is "No" (option B) :
Based on the wording MG is just a part of the overall strategy, rather than the entire solution.
In any other scenario the response would be "Yes" and that is based on the assumption that the strategy would include additional components along with management groups.
But the resources required by each business unit are identical which makes the inclusion of management groups unnecessary in this specific scenario.
Therefore, in this specific scenario, the answer would be "No".
upvoted 1 times

  **zimzimzimma** 4 weeks, 1 day ago
"Based on the wording MG is just a part of the overall strategy, rather than the entire solution."
But that's exactly what the question is stating?? It says management groups being INCLUDED in the strategy. Nowhere it is said that they're the entire solution. Of course you need ARM templates, but you can include management groups.
upvoted 1 times

  **Selma97** 4 months ago
Selected Answer: A
A. Yes, including management groups in the strategy is a good approach to creating Azure resources automatically for multiple business units. Management groups allow you to manage and organize multiple subscriptions and resources in a hierarchical structure, making it easier to apply policies and templates to multiple resources at once. By creating a management group for each business unit, you can easily apply the same policies and templates to all the resources associated with that business unit, making it simpler and more efficient to manage and govern your Azure resources.
upvoted 5 times

The answer is A. Yes

Using Azure Resource Manager (ARM) templates is a highly effective strategy for automatically creating and managing Azure resources, especially when you have identical requirements for multiple business units. ARM templates allow you to define your infrastructure as code, specifying the resources, configurations, and relationships in a declarative manner.

By creating ARM templates that represent the required resources, you can deploy them consistently across different business units while ensuring that the configurations are identical. This approach is efficient, repeatable, and scalable, making it a suitable solution for automating resource deployment.

Therefore, recommending the use of Azure Resource Manager templates in the strategy aligns with the goal of automatically creating Azure resources for each business unit.

SLA for Virtual Machines

Last updated: July 2020

For all Virtual Machines that have two or more instances deployed across two or more Availability Zones in the same Azure region, we guarantee you will have Virtual Machine Connectivity to at least one instance at least 99.99% of the time.

For all Virtual Machines that have two or more instances deployed in the same Availability Set or in the same Dedicated Host Group, we guarantee you will have Virtual Machine Connectivity to at least one instance at least 99.95% of the time.

For any Single Instance Virtual Machine using Premium SSD or Ultra Disk for all Operating System Disks and Data Disks, we guarantee you will have Virtual Machine Connectivity of at least 99.9%.

For any Single Instance Virtual Machine using Standard SSD Managed Disks for Operating System Disk and Data Disks, we guarantee you will have Virtual Machine Connectivity of at least 99.5%.

For any Single Instance Virtual Machine using Standard HDD Managed Disks for Operating System Disks and Data Disks, we guarantee you will have Virtual Machine Connectivity of at least 95%.

Answer correct.

upvoted 36 times

AntonioTech

Most Recent

3 weeks, 3 days ago

The answer is B. No

The solution does not meet the goal.

Azure's SLA for Virtual Machines with a single instance is 99.5% availability. To achieve a guaranteed availability of 99.99%, you would need to deploy the application in an architecture that takes advantage of Azure's higher availability options, such as Availability Zones.

For an SLA of 99.99%, deploying the application in at least two Availability Zones would be recommended. This would ensure that your application is highly available across separate physical locations, each with its own power, cooling, and networking, reducing the risk of a single point of failure. Simply deploying two virtual machines in a single Availability Zone would not achieve the desired level of availability.

Selected Answer: B

You need at least 2 virtual machines and 2 availability zone
upvoted 2 times
- BeauChateau** 6 months, 3 weeks ago

Selected Answer: B

B. No. The solution does not meet the goal. Having only two virtual machines and one availability zone cannot guarantee 99.99% availability, as it only offers 99.95% SLA. To achieve a guaranteed 99.99% availability, the strategy should include at least two or more virtual machines in two or more availability zones.
upvoted 8 times
- suresh_fx** 6 months, 3 weeks ago

No, the solution does not meet the goal.

In order to achieve a guaranteed availability of 99.99%, a higher level of redundancy and fault tolerance is required. The solution should include deploying the virtual machines across multiple availability zones or regions to provide geographic redundancy and fault tolerance. Additionally, the virtual machines should be configured with load balancing to ensure high availability and to distribute traffic evenly across the instances.

upvoted 9 times
-   **AlbertKwan** 10 months, 3 weeks ago

Source?
upvoted 1 times
-   **AntonioTech** Most Recent 3 weeks, 3 days ago

The answer is A. Yes

The solution meets the goal.

Deploying two virtual machines across two availability zones is a suitable strategy for achieving a guaranteed availability of 99.99 percent with the least virtual machines and availability zones. Azure Availability Zones are physically separate datacenters within an Azure region, providing redundancy and high availability.

By deploying the application to two virtual machines, each in a different availability zone, you ensure that even if one availability zone experiences an issue, the application remains available in the other availability zone. This setup minimizes the risk of downtime and meets the specified availability requirement of 99.99 percent.
upvoted 5 times
-   **Rainheart** 1 month ago

No, the solution does not meet the goal.

To achieve a guaranteed availability of 99.99%, you need to deploy your virtual machine in at least three availability zones. This is because Azure guarantees a 99.99% availability SLA for virtual machines that are deployed in three availability zones.
upvoted 1 times

- jana90

2 months, 3 weeks ago

🗨️ **AntonioTech** 3 weeks, 3 days ago

The answer is B. No

Microsoft Managed Desktop is not an appropriate solution for deploying and managing a large number of custom virtual machines on a weekly basis. Microsoft Managed Desktop is a service that provides managed Windows 10 devices for organizations, and it's not designed for managing virtual machines, especially with the frequency and diversity described in your scenario.

For managing virtual machines in Azure, a more suitable solution would be to use Azure Automation or Azure Resource Manager (ARM) templates. These tools allow you to automate the deployment and management of virtual machines, including the creation, configuration, and deletion of resources. You can define your desired state in code, and these tools will handle the provisioning and management tasks, reducing administrative effort.

Therefore, the solution of using Microsoft Managed Desktop does not meet the goal of reducing administrative effort for deploying and managing virtual machines in Azure.

upvoted 1 times

🗨️ **sudara** 1 month, 2 weeks ago

B. No

The solution does not meet the goal. Microsoft Managed Desktop is not a suitable Azure service for the scenario described. Microsoft Managed Desktop is a service that provides a managed Windows 10 experience for end-users, primarily for physical devices.

To reduce administrative effort for deploying and managing a large number of custom virtual machines on a weekly basis, you should consider using Azure DevTest Labs. Azure DevTest Labs allows you to quickly create, deploy, and manage virtual machines in a cost-effective manner. You can create custom virtual machine images with both Windows Server 2016 and Ubuntu Linux pre-installed, which can be used as a base for rapidly provisioning new virtual machines. DevTest Labs also enables you to set policies and quotas to control costs and resources.

By using Azure DevTest Labs, developers can self-provision virtual machines from pre-configured images without the need for significant administrative intervention, reducing administrative effort and streamlining the VM deployment process.

upvoted 4 times

🗨️ **jana90** 2 months, 3 weeks ago

Correct answer is Azure DevTest Labs.

Azure DevTest Labs is a service for easily creating, using, and managing infrastructure-as-a-service (IaaS) virtual machines (VMs) and platform-as-a-service (PaaS) environments in labs. Labs offer preconfigured bases and artifacts for creating VMs, and Azure Resource Manager (ARM) templates for creating environments like Azure Web Apps or SharePoint farms.

Lab owners can create preconfigured VMs that have tools and software lab users need. Lab users can claim preconfigured VMs, or create and configure their own VMs and environments. Lab policies and other methods track and control lab usage and costs.

<https://learn.microsoft.com/en-us/azure/devtest-labs/devtest-lab-overview>

upvoted 2 times

🗨️ **PirateKingKumar** 3 months, 1 week ago

The correct answer should be Azure Virtual machine scale sets.

For example, let's say you have a web application that experiences a spike in traffic during a certain time of day, such as during lunchtime. By using VMSS, you can set up a group of virtual machines to handle the increased traffic during that time, and then scale down the number of instances when the traffic decreases.

Question #23

Topic 1

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.

Your company's developers intend to deploy a large number of custom virtual machines on a weekly basis. They will also be removing these virtual machines during the same week it was deployed. Sixty percent of the virtual machines have Windows Server 2016 installed, while the other forty percent has Ubuntu Linux installed.

You are required to make sure that the administrative effort, needed for this process, is reduced by employing a suitable Azure service.

Solution: You recommend the use of Azure Reserved Virtual Machines (VM) Instances.

Does the solution meet the goal?

- A. Yes
- B. No

Correct Answer: B

An Azure Reserved Virtual Machine Instance (RI) is a virtual machine (VM) on the Microsoft Azure public cloud that has been reserved for dedicated use on a one- or three-year basis. ... Azure RIs are available for all Azure VM types, except for the A-series, A_v2 series and the G-series

upvoted 20 times
- AntonioTech

Most Recent

3 weeks, 3 days ago

The answer is B. No

Azure Reserved Virtual Machine (VM) Instances are not the most suitable solution for deploying and managing a large number of custom virtual machines on a weekly basis that are also removed during the same week. Reserved VM Instances are used to save costs by committing to a specific VM instance type for a one- or three-year term, which is not aligned with the short-term and frequent deployment and removal pattern described in your scenario.

To reduce administrative effort for your specific use case, you might consider using Azure DevTest Labs. Azure DevTest Labs allows you to quickly create environments in Azure while managing costs by setting up policies for resource usage. You can create a lab that aligns with your requirements, including Windows Server and Ubuntu Linux VMs, and allow your developers to deploy and remove VMs easily in a controlled environment.

Therefore, the solution of using Azure Reserved VM Instances does not meet the goal of reducing administrative effort for deploying and managing a large number of custom virtual machines on a weekly basis that are also removed within the same week.

The answer is A. Yes

The solution meets the goal.

Azure DevTest Labs is a suitable Azure service for managing the deployment and lifecycle of custom virtual machines, especially when they need to be created and removed frequently, as in your scenario. With Azure DevTest Labs, you can create a lab environment where developers can quickly create and manage virtual machines for development and testing purposes. The lab management capabilities allow you to set up policies, quotas, and schedules, which can help reduce administrative effort and manage costs.

By using Azure DevTest Labs, developers can easily deploy custom virtual machines with Windows Server 2016 and Ubuntu Linux as needed, and these VMs can be automatically cleaned up or removed at the end of the week. This approach streamlines the deployment and management process, ensuring that administrative effort is reduced while meeting the dynamic requirements of your developers.

Therefore, recommending the use of Azure DevTest Labs is a suitable solution for achieving the goal of reducing administrative effort for deploying and managing a large number of custom virtual machines on a weekly basis.

Question #25

Topic 1

Your company has virtual machines (VMs) hosted in Microsoft Azure. The VMs are located in a single Azure virtual network named VNet1. The company has users that work remotely. The remote workers require access to the VMs on VNet1. You need to provide access for the remote workers. What should you do?

- A. Configure a Site-to-Site (S2S) VPN.
- B. Configure a VNet-toVNet VPN.
- C. Configure a Point-to-Site (P2S) VPN.
- D. Configure DirectAccess on a Windows Server 2012 server VM.
- E. Configure a Multi-Site VPN

Correct Answer: C

A Point-to-Site (P2S) VPN gateway connection lets you create a secure connection to your virtual network from an individual client computer.

C. Configure a Point-to-Site (P2S) VPN.

To provide remote workers with access to the virtual machines (VMs) in the Azure virtual network (VNet), you should configure a Point-to-Site (P2S) VPN. P2S VPN allows individual remote clients to securely connect to the Azure VNet over the internet using a VPN client installed on their computer. This enables the remote workers to access the resources within VNet as if they were connected directly to the virtual network.

Correct answer is B. Solution : Azure Key Vault

upvoted 61 times
- AntonioTech

Most Recent

3 weeks, 2 days ago

Selected Answer: B

B. No

Azure Information Protection is primarily used for classifying, labeling, and protecting documents and emails containing sensitive information. It's not designed for encrypting administrative credentials during server deployment processes.

For encrypting administrative credentials during server deployment to Azure, a more suitable solution would be to use Azure Key Vault. Azure Key Vault is a cloud service that allows you to safeguard cryptographic keys, certificates, and secrets used by cloud applications and services. You can store the administrative credentials securely in Azure Key Vault and retrieve them when needed during the deployment process. This ensures that the credentials are properly protected and managed.

upvoted 5 times
- tyhtyhtyh

I just passed, a variation of MFA question was there so I recommend you guys to review it as I had 5 questions concerning MFA, SSO and authorization

upvoted 4 times
- BeauChateau

6 months, 3 weeks ago

Selected Answer: B

No, the recommended solution of Azure Multi-Factor Authentication (MFA) does not encrypt administrative credentials during server deployment to Azure. MFA is a solution that adds an additional layer of authentication to the login process, and it can help prevent unauthorized access to resources.

To encrypt administrative credentials during server deployment to Azure, a better solution would be to use Azure Key Vault. Azure Key Vault is a cloud-based service that provides secure storage of keys, secrets, and certificates. By storing the administrative credentials in Azure Key Vault, they can be encrypted and protected from unauthorized access.

Risk detection and remediation

Identity Protection identifies risks of many types, including:

Anonymous IP address use

Atypical travel

Malware linked IP address

Unfamiliar sign-in properties

Leaked credentials

Password spray

upvoted 72 times
-   **AntonioTech**

Most Recent

 3 weeks, 2 days ago

A. Yes

Azure AD Identity Protection is a comprehensive solution that helps you protect your organization's identities and detect and respond to potential identity-related risks. One of its features is the ability to configure risk-based policies. In this case, you can set up a risk-based policy that triggers a password change prompt for users when they connect to Azure AD via the internet from an unidentified IP address. This helps enhance security by encouraging users to change their passwords in case of suspicious activity.

So, the solution of configuring Azure AD Identity Protection meets the goal of encouraging users to change passwords under specific risk conditions.

upvoted 2 times
-   **jana90** 2 months, 3 weeks ago

Yes,

Correct answer is Azure AD Identity Protection.

Why would you encourage to change password in this scenario?

upvoted 6 times

tyhtyhtyh

3 months ago

https://learn.microsoft.com/en-us/azure/active-directory/identity-protection/howto-identity-protection-configure-risk-policies

"Require a secure password change when user risk level is High. Azure AD MFA is required before the user can create a new password with password writeback to remediate their risk."

Only the genuine user will have access to their MFA in order to perform a secure password change.

upvoted 1 times

Healthy_Harold

8 months, 1 week ago

I think to lock the genuine user out so that when they try to log in they are alerted that a bad actor has compromised their account? The strategy would only work well if end user is aware of this otherwise they would think they just forgot it.
Peace & Love
Harold.

Privileged Identity Management provides time-based and approval-based role activation to mitigate the risks of excessive, unnecessary, or misused access permissions on resources that you care about. Here are some of the key features of Privileged Identity Management:

Provide just-in-time privileged access to Azure AD and Azure resources

Assign time-bound access to resources using start and end dates

Require approval to activate privileged roles

Enforce multi-factor authentication to activate any role

Use justification to understand why users activate

Get notifications when privileged roles are activated

Conduct access reviews to ensure users still need roles

Download audit history for internal or external audit

Prevents removal of the last active Global Administrator role assignment

Question #32

Topic 1

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.

You are planning a strategy to deploy numerous web servers and database servers to Azure.

This strategy should allow for connection types between the web servers and database servers to be controlled.

Solution: You include a local network gateway in your strategy.

Does the solution meet the goal?

- A. Yes
- B. No

Correct Answer: B

Community vote distribution

B (100%)

- BinuRaj

Highly Voted

2 years, 2 months ago

The local network gateway is a specific object that represents your on-premises location (the site) for routing purposes.

upvoted 60 times
- PawanRastogi

Highly Voted

1 year, 11 months ago

A local network gateway represents the hardware or software VPN device in your local network. Use this with a connection to set up a site-to-site VPN connection between an Azure virtual network and your local network.

upvoted 33 times
- Sandip_Bhandari

Most Recent

2 weeks ago

NO.

A local network gateway in Azure is typically used when you want to establish a connection between your Azure virtual network and an on-premises network or another network outside of Azure. It's not directly related to controlling connection types between web servers and database servers within the same Azure virtual network.

To control the connection types between web servers and database servers in Azure, you would typically use Network Security Groups (NSGs), which allow you to define inbound and outbound traffic rules to control the flow of traffic between resources in a virtual network. You might also consider using Azure Firewall or Azure Application Gateway depending on your specific requirements.

So, including a local network gateway in your strategy is not the correct solution for controlling connections between web servers and database servers within Azure.

Yes, the solution meets the goal. Azure Multi-Factor Authentication (MFA) can be used to reduce the effect on users once the planned migration has been completed1
upvoted 1 times

  **sharontong316** 3 months, 3 weeks ago

You are required to employ a strategy that reduces the effect on users. If reducoes the effect on users, we will need Multi-Factor Authentication (MFA) to support users without efforts.
upvoted 2 times

  **shubham2811** 4 months, 1 week ago

Selected Answer: B

"You are required to employ a strategy that reduces the effect on users, once the planned migration has been completed.". Multi-factor authentication doesn't reduce the effect or have any kind of effect on this issue. MFA is used to verify the reinforce the security to identify a user, but it doesn't help at all in arranging the user's accounts

Answer Area

Statements

Yes

No

A platform as a service (PaaS) solution that hosts web apps in Azure provides full control of the operating systems that host applications.

☐☒

A platform as a service (PaaS) solution that hosts web apps in Azure provides the ability to scale the platform automatically .

☒☐

A platform as a service (PaaS) solution that hosts web apps in Azure provides professional development services to continuously add features to custom applications.

☒☐

Correct Answer:

Box 1: No -

A PaaS solution does not provide access to the operating system. The Azure Web Apps service provides an environment for you to host your web applications.

Behind the scenes, the web apps are hosted on virtual machines running IIS. However, you have no direct access to the virtual machine, the operating system or IIS.

Box 2: Yes -

A PaaS solution that hosts web apps in Azure does provide the ability to scale the platform automatically. This is known as autoscaling. Behind the scenes, the web apps are hosted on virtual machines running IIS. Autoscaling means adding more load balanced virtual machines to host the web apps.

Box 3: Yes -

PaaS provides a framework that developers can build upon to develop or customize cloud-based applications. PaaS development tools can cut the time it takes to code new apps with pre-coded application components built into the platform, such as workflow, directory services, security features, search and so on.

I think the answers are:

No, Yes, No.

PaaS does not provide professional services on add features to the applications! Anything related to the application is the responsibility of the customer in PaaS.

upvoted 73 times

  **sbettani** 3 years, 10 months ago

In my hopinion this refers to:

Advantages of PaaS

By delivering infrastructure as a service, PaaS offers the same advantages as IaaS. But its additional features—middleware, development tools, and other business tools—give you more advantages:

Cut coding time. PaaS development tools can cut the time it takes to code new apps with pre-coded application components built into the platform, such as workflow, directory services, security features, search, and so on.

Add development capabilities without adding staff. Platform as a Service components can give your development team new capabilities without your needing to add staff having the required skills.

Develop for multiple platforms—including mobile—more easily. Some service providers give you development options for multiple platforms, such as computers, mobile devices, and browsers making cross-platform apps quicker and easier to develop.

Regarding the third question, it seems as if is referring to DevOps/GitHub feature of Web App Service, which provides the functionality of "continous deployment".

As per Microsoft: "Web App Service not only adds the power of Microsoft Azure to your application, such as security, load balancing and autoscaling. You can also take advantage of its DevOps capabilities, such as continuous deployment from Azure DevOps, GitHub, and other sources."

Azure PaaS services, such as Azure App Service, Azure Functions, and Azure Kubernetes Service (AKS), provide autoscaling capabilities that allow you to automatically adjust the number of resources allocated to your application based on the workload demands. This can help ensure that your application performs well and remains highly available even during peak traffic periods.

Question #35

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
Azure provides flexibility between capital expenditure (CapEx) and operational expenditure (OpEx).	☐	☐
If you create two Azure virtual machines that use the B2S size, each virtual machine will always generate the same monthly costs.	☐	☐
When an Azure virtual machine is stopped, you continue to pay storage costs associated to the virtual machine.	☐	☐

Answer Area

Statements	Yes	No
Azure provides flexibility between capital expenditure (CapEx) and operational expenditure (OpEx).	☒	☐
If you create two Azure virtual machines that use the B2S size, each virtual machine will always generate the same monthly costs.	☐	☒
When an Azure virtual machine is stopped, you continue to pay storage costs associated to the virtual machine.	☒	☐

Correct Answer:

Box 1: Yes -

Traditionally, IT expenses have been considered a Capital Expenditure (CapEx). Today, with the move to the cloud and the pay-as-you-go model, organizations have the ability to stretch their budgets and are shifting their IT CapEx costs to Operating Expenditures (OpEx) instead. This flexibility, in accounting terms, is now an option due to the "as a Service" model of purchasing software, cloud storage and other IT related resources.

Box 2: No -

Two virtual machines using the same size could have different disk configurations. Therefore, the monthly costs could be different.

Box 3: Yes -

When an Azure virtual machine is stopped, you don't pay for the virtual machine. However, you do still pay for the storage costs associated to

the virtual machine.

The most common storage costs are for the disks attached to the virtual machines. There are also other storage costs associated with a virtual machine such as storage for diagnostic data and virtual machine backups.

Correct. Y,N,Y. Storage cost are separate. In Azure stopping VM and de-allocating / deleting VM is different. If you stop VM still you need storage space to store VM image and which will cost you. Cost is Azure have different meters so VM costly will be possibly different at end of month.

The Azure provides resources in OpEx, I understand CapEx is a resource of data center local. Maybe the flexibility said is the client use reference own datacenter witch resources of the Azure.

upvoted 1 times
- luckygil**

7 months ago

ChatGPT said like that

Azure is a cloud computing platform and service provided by Microsoft. As a cloud computing service, Azure provides customers with the ability to consume computing resources on a pay-per-use basis, which is typically classified as an operating expense (OpEx) rather than a capital expense (CapEx).

Customers can use Azure to access a wide range of computing resources, such as virtual machines, storage, and networking, without the need to purchase and maintain their own hardware. This pay-as-you-go model allows customers to scale up or down their usage of computing resources based on their business needs, and pay only for what they use, similar to a utility bill.

While Azure may not provide CapEx in the traditional sense, it does allow customers to potentially reduce their CapEx by reducing the need to purchase and maintain their own hardware. Additionally, Azure offers some purchasing options, such as reserved instances, which can provide cost savings for customers who commit to using specific computing resources for a set period of time.

Meters for storage are separate from Meters for VM, the second question is correct, but, it is because of varying consumption, not varying storage... in the bill, the VM storage is on a Storage meter, segregating it's cost from the VM. To combine them, I think you have to tag them...

Answer Area

When you are implementing a Software as a Service (SaaS) solution, you are responsible for

Correct Answer:

configuring high availability.
defining scalability rules.
installing the SaaS solution.
configuring the SaaS solution.

When you are implementing a Software as a Service (SaaS) solution, you are responsible for configuring the SaaS solution. Everything else is managed by the cloud provider.

SaaS requires the least amount of management. The cloud provider is responsible for managing everything, and the end user just uses the software.

Software as a service (SaaS) allows users to connect to and use cloud-based apps over the Internet. Common examples are email, calendaring and office tools (such as Microsoft Office 365).

SaaS provides a complete software solution which you purchase on a pay-as-you-go basis from a cloud service provider. You rent the use of an app for your organization and your users connect to it over the Internet, usually with a web browser. All of the underlying infrastructure, middleware, app software and app data are located in the service provider's data center. The service provider manages the hardware and software and with the appropriate service agreement, will ensure the availability and the security of the app and your data as well.

Question #37

Topic 1

You have an on-premises network that contains several servers.

You plan to migrate all the servers to Azure.

You need to recommend a solution to ensure that some of the servers are available if a single Azure data center goes offline for an extended period.

What should you include in the recommendation?

- A. fault tolerance
- B. elasticity
- C. scalability
- D. low latency

Correct Answer: A

Fault tolerance is the ability of a system to continue to function in the event of a failure of some of its components.

In this question, you could have servers that are replicated across datacenters.

Availability zones expand the level of control you have to maintain the availability of the applications and data on your VMs. Availability Zones are unique physical locations within an Azure region. Each zone is made up of one or more datacenters equipped with independent power, cooling, and networking. To ensure resiliency, there are a minimum of three separate zones in all enabled regions. The physical separation of Availability Zones within a region protects applications and data from datacenter failures.

With Availability Zones, Azure offers industry best 99.99% VM uptime SLA. By architecting your solutions to use replicated VMs in zones, you can protect your applications and data from the loss of a datacenter. If one zone is compromised, then replicated apps and data are instantly available in another zone.

Availability Regions contain Availability Zones (Datacenters). If you have a mission-critical app that your customers require access to frequently, you would want redundancy for your databases, meaning you would like to have copies of databases spread across different yet nearby AZs. Hence, in an event of a failure, your AZ should have "Fault Tolerance" Capability.

Correct Answer:

Answer Area

An organization that hosts its infrastructure

▼

 no longer requires a data center .

in a private cloud

in a hybrid cloud

in the public cloud

on a Hyper-V host

A private cloud is hosted in your datacenter. Therefore, you cannot close your datacenter if you are using a private cloud.

A public cloud is hosted externally, for example, in Microsoft Azure. An organization that hosts its infrastructure in a public cloud can close its data center.

Public cloud is the most common deployment model. In this case, you have no local hardware to manage or keep up-to-date as everything runs on your cloud provider's hardware.

Microsoft Azure is an example of a public cloud provider.

In a private cloud, you create a cloud environment in your own datacenter and provide self-service access to compute resources to users in your organization.

This offers a simulation of a public cloud to your users, but you remain completely responsible for the purchase and maintenance of the hardware and software services you provide.

Question #39

Topic 1

What are two characteristics of the public cloud? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

- A. dedicated hardware
- B. unsecured connections
- C. limited storage
- D. metered pricing
- E. self-service management

Correct Answer: *DE*

With the public cloud, you get pay-as-you-go pricing æ" you pay only for what you use, no CapEx costs.
With the public cloud, you have self-service management. You are responsible for the deployment and configuration of the cloud resources such as virtual machines or web sites. The underlying hardware that hosts the cloud resources is managed by the cloud provider.

Incorrect Answers:

A: You don't have dedicated hardware. The underlying hardware is shared so you could have multiple customers using cloud resources hosted on the same physical hardware.
B: Connections to the public cloud are secure.
C: Storage is not limited. You can have as much storage as you like.

Cloud does provide (D) metered pricing, as you pay for the resources you use. Also provides (E) a self-managed service, as you can use the portal to add, change and also remove the resources you need when you need them.Hardware is shared among public cloud clients, so it is NOT dedicated. Connections on cloud are SECURED, so B do not apply to Public Cloud. Storage is virtually unlimited on the cloud, so C do not apply.
upvoted 102 times
- ultraOriginalVillain** 3 years, 5 months ago

so basically A,B,C do not make sense in the case of cloud computing so they are automatically wrong and D, E are correct for just about any type of cloud storage (public, enterprise, private or hybrid).

It's a trick question where they mention public cloud simply as a catch/confusion.
upvoted 9 times
- penguincapo** 2 years, 7 months ago

Isn't dedicated hardware provided to you in private cloud in case you hire a cloud provider to implement your private cloud? Reserved Instances also I think provide dedicated hardware, don't they? Please correct me if I am wrong.
upvoted 3 times
- shadeey** 1 year, 9 months ago

dedicated = private,
it would mean they reserve machines for you. we re talking public here
upvoted 4 times
- chop_z_azur** 1 year, 3 months ago

There is something called Azure Dedicated Host, but it's a very specific service. This is more a general question and in sense in Public Cloud you do not have dedicated HW.
upvoted 1 times
- palashroy** 1 year, 8 months ago

Agree D,E correct. But if we choose Isolated App Service plan, dedicated hardware isallocated for you. So, A is also possible. Point A is is not complete question.

The correct answers are:

D. metered pricing
E. self-service management

Explanation:

A. Dedicated hardware is not a characteristic of the public cloud. Public cloud providers share their infrastructure among many customers to optimize resource utilization and reduce costs.

B. Public cloud providers typically use secure connections to protect data in transit, so unsecured connections are not a characteristic of the public cloud.

C. Public cloud providers offer virtually unlimited storage, so limited storage is not a characteristic of the public cloud.

D. Public cloud providers charge for their services based on usage, so metered pricing is a key characteristic of the public cloud.

E. Public cloud providers offer self-service management interfaces that enable customers to deploy and manage their own applications and services, so self-service management is a key characteristic of the public cloud.

Question #40

Topic 1

HOTSPOT -

To complete the sentence, select the appropriate option in the answer area.

Hot Area:

Answer Area

When planning to migrate a public website to Azure,
you must plan to

deploy a VPN.
pay monthly usage costs.
pay to transfer all the website data to Azure.
reduce the number of connections to the website.

Answer Area

Correct Answer:

When planning to migrate a public website to Azure,
you must plan to

deploy a VPN.
pay monthly usage costs.
pay to transfer all the website data to Azure.
reduce the number of connections to the website.

When planning to migrate a public website to Azure, you must plan to pay monthly usage costs. This is because Azure uses the pay-as-you-go model.

Another question from todays exam was
On which layer is ddos protection applied?
Application layer
Network layer
Perimeter layer
upvoted 48 times

  **nduan** 1 week, 4 days ago

Answer: Network layer - Azure DDoS Protection protects at layer 3 and layer 4 NETWORK layers. For web applications protection at layer 7, you need to add protection at the application layer using a WAF offering. Details see at <https://learn.microsoft.com/en-us/azure/ddos-protection/ddos-protection-overview>
upvoted 1 times

  **SiafSy** 1 month, 2 weeks ago

In the context of Microsoft Azure and specifically in the context of the AZ-900 certification exam, the correct answer would be "Perimeter layer."

In the AZ-900 exam, when referring to DDoS protection, Microsoft focuses on the concept of protecting the resources and services at the edge or perimeter of the Azure network. Azure DDoS Protection Standard is a service that provides DDoS protection specifically at the Azure network edge.

upvoted 2 times

  **ogmandalorian** 5 months, 2 weeks ago
Answer: Pay monthly usage costs.

Explanation:
When migrating a public website to Azure, you need to plan for the pricing model that Azure provides. Azure charges for the usage of resources such as virtual machines, storage, and data transfer. Therefore, you need to plan to pay monthly usage costs for hosting the website on Azure. Deploying a VPN, paying to transfer all the website data to Azure, or reducing the number of connections to the website are not necessarily required for migrating a public website to Azure.

Question #41

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

Your company plans to migrate all its data and resources to Azure.

The company's migration plan states that only Platform as a Service (PaaS) solutions must be used in Azure.

You need to deploy an Azure environment that meets the company migration plan.

Solution: You create an Azure App Service and Azure SQL databases.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: A

Azure App Service and Azure SQL databases are examples of Azure PaaS solutions. Therefore, this solution does meet the goal.

Question #42

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

Your company plans to migrate all its data and resources to Azure.

The company's migration plan states that only Platform as a Service (PaaS) solutions must be used in Azure.

You need to deploy an Azure environment that meets the company migration plan.

Solution: You create an Azure App Service and Azure virtual machines that have Microsoft SQL Server installed.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: A

Azure App Service is a PaaS (Platform as a Service) service. Azure virtual machines are an IaaS (Infrastructure as a Service) service, and a PaaS service.

Therefore, this solution does meet the goal.

Note: Like IaaS, PaaS includes infrastructure "servers, storage, and networking" but also middleware, development tools, business intelligence (BI) services, database management systems, and more. PaaS is designed to support the complete web application lifecycle: building, testing, deploying, managing, and updating.

1 year, 7 months ago

I agree.. as per Microsoft DOC the answer shoule be NO

upvoted 4 times
- johnyjohny1**

2 years, 5 months ago

You have to go back and study the responsibility model a bit more. It has nothing to do with "what's underneath", but what share of the responsibility lies on you, the buyer of the service. When you get PaaS, you don't manage anything you would manage in IaaS. If you put your servers in VMs, you have to manage infrastructure, thus you, as the user, are not doing PaaS.

upvoted 47 times
- Cryptomike87**

2 years ago

WRONG! If you deploy a VM (IaaS) you are responsible for managing it. The answer to this question is NO.

  **AntonioTech** 6 days, 18 hours ago
Selected Answer: B
To the admin: Why are you NOT fixing the wrong answers? There are way too many wrong answers. Why are we paying for wrong answers? This is not fair.
B. No

The solution you've described does not meet the company's migration plan, which states that only Platform as a Service (PaaS) solutions must be used in Azure. In your solution, you've mentioned deploying Azure virtual machines with Microsoft SQL Server installed. Virtual machines (VMs) are considered Infrastructure as a Service (IaaS) solutions, not PaaS.

To meet the goal and align with the company's migration plan, you should focus on deploying Azure PaaS services such as Azure SQL Database (PaaS database service) instead of installing SQL Server on virtual machines. PaaS services abstract the underlying infrastructure and provide managed, scalable solutions that align with the PaaS model.
upvoted 2 times

  **Sandip_Bhandari** 2 weeks ago
No, this does not meet the goal of using only Platform as a Service (PaaS) solutions in Azure.

In the solution you described, you are deploying Azure virtual machines with Microsoft SQL Server installed. Azure virtual machines are considered Infrastructure as a Service (IaaS) because you are responsible for managing the virtual machines and the software running on them, including SQL Server. This is not a pure PaaS solution.

To meet the company's migration plan, you should use Azure PaaS services, such as Azure SQL Database (PaaS offering for SQL Server) instead of deploying SQL Server on virtual machines. Azure App Service is a PaaS offering for hosting web applications, so that part aligns with the plan. However, for the database, you should use Azure SQL Database or another appropriate Azure PaaS database service rather than managing SQL Server on virtual machines.
upvoted 2 times

  **khehla** 3 weeks ago
The clue is in " you CREATE an Azure App Service and a Virtual Machine running SQL Database" once you have the ability to create the virtual machine, it then becomes IaaS answer is NO.

Selected Answer: A

Yes, both Azure App Service and Azure Storage accounts are Platform as a Service (PaaS) offerings in Azure.

Deploying Azure App Service and Azure Storage accounts aligns with your company's migration plan to use PaaS solutions in Azure. These services simplify the management of resources, reduce administrative overhead, and allow you to focus on building and deploying your applications and storing your data without worrying about the infrastructure details.
upvoted 1 times

  **Sandip_Bhandari** 2 weeks ago

YES.

Creating an Azure App Service and Azure Storage accounts aligns with the company's migration plan of using Platform as a Service (PaaS) solutions in Azure.

Azure App Service is a fully managed platform for building, deploying, and scaling web apps, APIs, and mobile backends. It is a PaaS offering, and you don't need to manage the underlying infrastructure.

Azure Storage accounts provide PaaS storage solutions for various data types, including blobs, files, queues, and tables. They are fully managed by Azure, so you don't have to worry about the infrastructure.

This solution adheres to the PaaS requirement, as opposed to Infrastructure as a Service (IaaS), where you would be responsible for managing virtual machines and the software installed on them.
upvoted 2 times

  **AntonioTech** 3 weeks, 2 days ago

Selected Answer: A

A. Yes

Creating an Azure App Service and Azure Storage accounts aligns with the use of Platform as a Service (PaaS) solutions as required by the company's migration plan.

Azure App Service is a PaaS offering that allows you to build, deploy, and scale web applications and APIs without managing the underlying infrastructure. Azure Storage accounts provide various PaaS storage services like Blob Storage, Queue Storage, Table Storage, and File Storage, which abstract away the underlying storage infrastructure management.

So, deploying an Azure App Service and Azure Storage accounts meets the goal of using PaaS solutions for the migration plan.

  **DavidCarp** 2 months, 1 week ago

Answer is Yes.

Azure App Service and Azure Storage accounts are both PaaS solutions.

Azure App Service is a platform-as-a-service (PaaS) offering that lets create web and mobile apps for any platform or device and connect to data anywhere, in the cloud or on-premises.

<https://learn.microsoft.com/en-us/azure/security/fundamentals/paas-applications-using-app-services>

Azure Storage provides highly available, secure, durable, massively scalable, and redundant storage for data objects in the cloud.
<https://learn.microsoft.com/en-us/azure/storage/common/storage-introduction>

upvoted 1 times

  **jessyMIH** 2 months, 1 week ago

Oui, la solution proposée répond à l'objectif de n'utiliser que des solutions Platform as a Service (PaaS) dans Azure. L'utilisation d'Azure App Service est une solution PaaS pour l'hébergement d'applications web, tandis que l'utilisation des comptes Azure Storage correspond également à une solution PaaS pour le stockage de données dans le cloud.

Azure Storage offre plusieurs services PaaS, notamment Azure Blob Storage, Azure Queue Storage et Azure Table Storage, qui permettent de stocker différents types de données de manière évolutive et hautement disponible.

En utilisant Azure App Service et les comptes Azure Storage, vous pouvez déployer des applications web dans un environnement PaaS tout en utilisant des services de stockage cloud natifs, conformément aux exigences du plan de migration de l'entreprise.

From : ChatGPT

Azure Storage accounts provide scalable and durable storage services in the cloud. They support various storage services such as blobs, files, queues, and tables. Azure Storage accounts also offer features like automatic replication, high availability, and data encryption. While Azure Storage accounts are not strictly categorized as PaaS, they are considered as foundational services in Azure that can be leveraged by PaaS solutions.

upvoted 1 times

  **Kabindas** 2 months, 2 weeks ago

Selected Answer: A

WRONG !!! Azure Storage account is considered a Platform as a Service (PaaS) offering in Microsoft Azure. While it provides underlying infrastructure resources like servers, storage, and networking, the management and maintenance of these resources are handled by Azure, relieving users from the responsibility of managing the infrastructure themselves.

upvoted 1 times

  **zimzimzimma** 2 months, 3 weeks ago

Oh my, 300 answers and counting. I think it's A.
Azure storage accounts aren't IaaS, nor PaaS, nor SaaS. They are merely containers to other services. Azure Storage is a PaaS solution as stated in <https://docs.microsoft.com/en-us/learn/modules/azure-networking-fundamentals/azure-virtual-network-fundamentals> at 1:14.
So A: yes.
upvoted 1 times

  **PeteColag** 2 months, 4 weeks ago

Selected Answer: A

Azure App Service and Azure Storage are both PaaS. You don't need to install any VMs to run these services, hence these are not IaaS.
upvoted 1 times

  **AkiLuck** 2 months, 3 weeks ago

VM is not the only type of infrastructure. Storage is also a part of infrastructure. In fact you cannot use a VM without storage.
upvoted 1 times

  **n00bofn00bs** 3 months ago

data still needs to be written somewhere. i use azure file sync servers at branches, which sync data to storage accounts, it doesn't make it IaaS, the file server is on prem, utilising azure storage..
upvoted 1 times

Question #44

Topic 1

Your company hosts an accounting application named App1 that is used by all the customers of the company. App1 has low usage during the first three weeks of each month and very high usage during the last week of each month. Which benefit of Azure Cloud Services supports cost management for this type of usage pattern?

- A. high availability
- B. high latency
- C. elasticity
- D. load balancing

Correct Answer: C

Elasticity in this case is the ability to provide additional compute resource when needed and reduce the compute resource when not needed to reduce costs.

Autoscaling is an example of elasticity.

Elastic computing is the ability to quickly expand or decrease computer processing, memory and storage resources to meet changing demands without worrying about capacity planning and engineering for peak usage. Typically controlled by system monitoring tools, elastic computing matches the amount of resources allocated to the amount of resources actually needed without disrupting operations. With cloud elasticity, a company avoids paying for unused capacity or idle resources and doesn't have to worry about investing in the purchase or maintenance of additional resources and equipment.

Question #45

Topic 1

You plan to migrate a web application to Azure. The web application is accessed by external users.

You need to recommend a cloud deployment solution to minimize the amount of administrative effort used to manage the web application.

What should you include in the recommendation?

- A. Software as a Service (SaaS)
- B. Platform as a Service (PaaS)
- C. Infrastructure as a Service (IaaS)
- D. Database as a Service (DaaS)

Correct Answer: B

Azure App Service is a platform-as-a-service (PaaS) offering that lets you create web and mobile apps for any platform or device and connect to data anywhere, in the cloud or on-premises. App Service includes the web and mobile capabilities that were previously delivered separately as Azure Websites and Azure Mobile Services.

  **agaonion** 9 months, 1 week ago

Selected Answer: B

Answer: B PaaS

upvoted 1 times

  **AlbertKwan** 10 months, 2 weeks ago

Selected Answer: B

B is correct because you want to develop / maintain the code of the app. A is wrong because in SaaS, Microsoft develops / maintaisn the code of the app (such as Microsoft Office 365).

What is SaaS?
A SaaS solution requires the least management. Microsoft is responsible for managing everything, and you just use the software. SaaS allows you to connect to and use cloud-based apps over the Internet. When you are implementing a SaaS solution, you are responsible for configuring the SaaS solution. Common examples are Outlook email, calendar, and office tools (such as Microsoft Office 365).

Platform as a Service(PaaS)

upvoted 1 times

Question #46

Topic 1

HOTSPOT -

Which cloud deployment solution is used for Azure virtual machines and Azure SQL databases? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Azure virtual machines:

Infrastructure as a service (IaaS)

Platform as a service (PaaS)

Software as a service (SaaS)

Azure SQL databases:

Infrastructure as a service (IaaS)

Platform as a service (PaaS)

Software as a service (SaaS)

Correct Answer:

Answer Area

Azure virtual machines:

Infrastructure as a service (IaaS)

Platform as a service (PaaS)

Software as a service (SaaS)

Azure SQL databases:

Infrastructure as a service (IaaS)

Platform as a service (PaaS)

Software as a service (SaaS)

Box 1:

Azure virtual machines are Infrastructure as a Service (IaaS).

Infrastructure as a Service is the most flexible category of cloud services. It aims to give you complete control over the hardware that runs your application (IT infrastructure servers and virtual machines (VMs), storage, networks, and operating systems). Instead of buying hardware, with IaaS, you rent it.

Box 2:

Azure SQL databases are Platform as a Service (PaaS).

Azure SQL Database is a fully managed Platform as a Service (PaaS) Database Engine that handles most of the database management functions such as upgrading, patching, backups, and monitoring without user involvement. Azure SQL Database is always running on the latest stable version of SQL Server Database Engine and patched OS with 99.99% availability. PaaS capabilities that are built-in into Azure SQL database enable you to focus on the domain specific database administration and optimization activities that are critical for your business.

Question #47

Topic 1

You have an on-premises network that contains 100 servers.

You need to recommend a solution that provides additional resources to your users. The solution must minimize capital and operational expenditure costs.

What should you include in the recommendation?

- A. a complete migration to the public cloud
- B. an additional data center
- C. a private cloud
- D. a hybrid cloud

Correct Answer: D

A hybrid cloud is a combination of a private cloud and a public cloud.

Capital expenditure is the spending of money up-front for infrastructure such as new servers.

With a hybrid cloud, you can continue to use the on-premises servers while adding new servers in the public cloud (Azure for example). Adding new servers in

Azure minimizes the capital expenditure costs as you are not paying for new servers as you would if you deployed new server on-premises.

Incorrect Answers:

A: A complete migration of 100 servers to the public cloud would involve a lot of operational expenditure (the cost of migrating all the servers).

B: An additional data center would involve a lot of capital expenditure (the cost of the new infrastructure).

C: A private cloud is hosted on on-premises servers to this would involve a lot of capital expenditure (the cost of the new infrastructure to host the private cloud).

Question #48

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Statements	Yes	No
To achieve a hybrid cloud model, a company must always migrate from a private cloud model.	☐	☐
A company can extend the capacity of its internal network by using the public cloud.	☐	☐
In a public cloud model, only guest users at your company can access the resources in the cloud.	☐	☐

Correct Answer:

Statements	Yes	No
To achieve a hybrid cloud model, a company must always migrate from a private cloud model.	☐	☒
A company can extend the capacity of its internal network by using the public cloud.	☒	☐
In a public cloud model, only guest users at your company can access the resources in the cloud.	☐	☒

Box 1: No -

It is not true that a company must always migrate from a private cloud model to implement a hybrid cloud. You could start with a public cloud and then combine that with an on-premise infrastructure to implement a hybrid cloud.

Box 2: Yes -

A company can extend the capacity of its internal network by using the public cloud. This is very common. When you need more capacity, rather than pay out for new on-premises infrastructure, you can configure a cloud environment and connect your on-premises network to the cloud environment by using a VPN.

Box 3: No -

It is not true that only guest users can access cloud resources. You can give anyone with an account in Azure Active Directory access to the cloud resources.

There are many authentication scenarios but a common one is to replicate your on-premises Active Directory accounts to Azure Active Directory and provide access to the Azure Active Directory accounts. Another commonly used authentication method is 'Federation' where authentication for access to cloud resources is passed to another authentication provider such as an on-premises Active Directory.

upvoted 3 times

  **BMF** 9 months, 2 weeks ago
what is your answer?
upvoted 1 times

  **WizzAPPP** 12 months ago
No No No. I disagree. It is not stating it will extend the internal network. It is stating it can extend the CAPACITY of the network. Meaning you can offload resources into the public cloud easier than in your internal network.. i.e Even with VPN, this doesn't qualify as an internal network extension but an extension of the total network.
upvoted 3 times

  **Jacobson02** 1 year ago
Weird that the second question would be no. How does VPNing to the public cloud extend the capacity of your internal network? By comparison if I installed an on prem server, I wouldn't say that my network capacity has increased. So connecting to one in the cloud wouldn't either, would it.
upvoted 1 times

  **yoobro** 1 year, 1 month ago
What is an internal network? Ask yourself.
An internal network means it's like a Private network. When you reach the public cloud, it's not an internal network.

Question #49

Topic 1

You plan to migrate several servers from an on-premises network to Azure.
What is an advantage of using a public cloud service for the servers over an on-premises network?

- A. The public cloud is owned by the public, NOT a private corporation
- B. The public cloud is a crowd-sourcing solution that provides corporations with the ability to enhance the cloud
- C. All public cloud resources can be freely accessed by every member of the public
- D. The public cloud is a shared entity whereby multiple corporations each use a portion of the resources in the cloud

Correct Answer: D

The public cloud is a shared entity whereby multiple corporations each use a portion of the resources in the cloud. The hardware resources (servers, infrastructure etc.) are managed by the cloud provider. Multiple companies create resources such as virtual machines and virtual networks on the hardware resources.

Incorrect Answers:

A: The public cloud is not owned by the public. In the case of Microsoft Azure, the cloud is owned by Microsoft.

B: The public cloud is a not crowd-sourcing solution. In the case of Microsoft Azure, the cloud is owned by Microsoft.

C: It is not true that public cloud resources can be freely accessed by every member of the public. You pay for a cloud subscription and create accounts for your users to access your cloud resources. No one can access your cloud resources until you create user accounts and provide the appropriate access permissions.

D. The advantage of using a public cloud service for the servers over an on-premises network is that the public cloud is a shared entity whereby multiple corporations each use a portion of the resources in the cloud. This means that the cost of the resources is shared among multiple organizations, allowing for cost savings and scalability as needed. Additionally, the public cloud provides a high level of availability and redundancy, with built-in features for disaster recovery and backup.

  **SNBose** 1 week ago
Azure Site Recovery (ASR) provides 2. Disaster recovery for virtual machines.

ASR is a service in Azure that enables disaster recovery for on-premises or Azure virtual machines. It helps protect and recover virtualized workloads by replicating virtual machines from a primary site to a secondary site (Azure or another on-premises location). In the event of a disaster or an outage at the primary site, ASR can fail over to the secondary site to ensure business continuity and data recovery.

While ASR contributes to business continuity and data protection, it's important to note that it does not provide fault tolerance, elasticity, or high availability on its own. These other concepts may involve different Azure services and configurations.
upvoted 1 times

  **Sandip_Bhandari** 2 weeks ago
Azure Site Recovery provides disaster recovery capabilities for virtual machines (VMs). It allows you to replicate VMs from your primary data center or on-premises infrastructure to Azure, providing a failover solution in case of a disaster or outage. This enables you to maintain business continuity by ensuring the availability of your VMs and data in Azure if your primary infrastructure becomes unavailable.
upvoted 1 times

  **drpp** 2 weeks, 1 day ago
DISASTER RICOVERY :
Is disaster recovery supported for Azure VMs?
Yes, Site Recovery supports disaster for Azure VMs between Azure regions. Review common questions about Azure VM disaster recovery. If you want to replicate between two Azure regions on the same continent, please use our Azure to Azure DR offering. No need to set up configuration server/process server and ExpressRoute connections.

You can set up disaster recovery of Azure VMs from a primary region to a secondary region.
ans:disaster recovery
upvoted 1 times

  **VinnyMacD** 1 month, 1 week ago

fault tolerance is when machine(s) are configured in High Availability mode and if one fails the other one keeps on running.
Since this is replication of machines when during an event, this is recovery ie. Disaster Recovery. Disaster Recovery is the right answer.
upvoted 1 times

  **Ayman_B** 1 month, 1 week ago

"The Azure Site Recovery service enables organizations to easily replicate virtual machines and physical servers from a primary site to a secondary site in support of business continuity. Not only can you replicate VMs between regions, but you can also replicate physical servers or VMs from your own data center to Azure".(Microsoft Certified Azure Fundamentals-study guide).

so I think the answer is "Fault tolerance"
upvoted 1 times

  **AzureEntrust** 1 month, 2 weeks ago

This is coming straight from MS documentation:
"Site Recovery is a native disaster recovery as a service (DRaaS)". I tend to agree the fault tolerance is for recovering from small scale outage such as a VM crashing. A full scale switch over to another region would be recovering from a disaster. If you ponder on the question a while it sounds like fault tolerance is the correct answer since it is saying Azure Site Recovery provides _____ for Virtual Machines. It would be Disaster recovery had the question been Site Recovery provides _____ for a region.
upvoted 1 times

  **aj606in** 1 month, 3 weeks ago

Azure Site Recovery provides resilience and disaster recovery for apps and workloads running on on-premises machines, or Azure IaaS VMs. Site Recovery orchestrates replication, and handles failover to Azure when outages occur.
upvoted 1 times

  **smanchan** 1 month, 3 weeks ago

ASR can be used for both fault tolerance and disaster recovery.
upvoted 1 times

  **smanchan** 1 month, 3 weeks ago

Fault Tolerance and not Disaster recovery because its mentioned per "site". FT avoid downtime completely. In a complete system failure however, high availability and fault tolerance are not enough. Disaster recovery describes how the system can continue to operate when the cushion of high availability and fault tolerance disappears in a system wide failure.
upvoted 1 times

  **Riyaaaaa** 1 month, 3 weeks ago

Azure Site Recovery provides disaster recovery as a service (DRaaS) for virtual machines.

Correct Answer:**Answer Area**

▼

An availability set
Azure Spot Virtual Machines
Azure Virtual Desktop
Azure Virtual Machine Scale Sets

is a desktop and application virtualization service that enables the use of a cloud-hosted version of Windows from any location

Question #53

Topic 1

You have 1,000 virtual machines hosted on the Hyper-V hosts in a data center.

You plan to migrate all the virtual machines to an Azure pay-as-you-go subscription.

You need to identify which expenditure model to use for the planned Azure solution.

Which expenditure model should you identify?

- A. operational
- B. elastic
- C. capital
- D. scalable

Correct Answer: A

One of the major changes that you will face when you move from on-premises cloud to the public cloud is the switch from capital expenditure (buying hardware) to operating expenditure (paying for service as you use it). This switch also requires more careful management of your costs. The benefit of the cloud is that you can fundamentally and positively affect the cost of a service you use by merely shutting down or resizing it when it's not needed.

Reference:

<https://docs.microsoft.com/en-us/azure/architecture/cloud-adoption/appendix/azure-scaffold>

Community vote distribution

A (100%)

-   **rgalfaro**

Highly Voted 

 3 years, 9 months ago

The expenditure models are either CapEx or OpEx (Capital or Operational). CapEx is what you pay upfront, on prem, for servers, racks, cooling, security, the Datacenter itself. OpEx is what you pay to keep your infrastructure operational, like IT staff. In this case, when you move to the Cloud, what you identify in this case is the OpEx or Operational model. This is because you actually don't have CapEx on the Cloud (or at least you look to minimize CapEx) as you pay for the resources you use and not for the underlying hardware, security, cooling, etc that you will pay for in an On-Prem solution. That is why the right answer is (A) Operational. Elastic and Scalable are not expenditure models.

Question #54

Topic 1

DRAG DROP -

Match the Azure services benefits to the correct descriptions.

Instructions: To answer, drag the appropriate benefit from the column on the left to its description on the right. Each benefit may be used once, more than once, or not at all.

NOTE: Each correct match is worth one point.

Select and Place:

Answer Options	Answer Area	
Disaster recovery	A cloud service that remains available after a failure occurs	
Fault tolerance	A cloud service that can be recovered after a failure occurs	
Low latency	A cloud service that performs quickly when demand increases	
Dynamic scalability	A cloud service that can be accessed quickly from the Internet.	

Correct Answer:

Answer Options	Answer Area	
	A cloud service that remains available after a failure occurs	Fault tolerance
	A cloud service that can be recovered after a failure occurs	Disaster recovery
	A cloud service that performs quickly when demand increases	Dynamic scalability
	A cloud service that can be accessed quickly from the Internet.	Low latency

Box 1:

Fault tolerance is the ability of a service to remain available after a failure of one of the components of the service. For example, a service running on multiple servers can withstand the failure of one of the servers.

Box 2:

Disaster recovery is the recovery of a service after a failure. For example, restoring a virtual machine from backup after a virtual machine failure.

Box 3:

Dynamic scalability is the ability for compute resources to be added to a service when the service is under heavy load. For example, in a virtual machine scale set, additional instances of the virtual machine are added when the existing virtual machines are under heavy load.

Box 4:

Latency is the time a service to respond to requests. For example, the time it takes for a web page to be returned from a web server. Low latency means low response time which means a quicker response.

Question #55

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
To implement a hybrid cloud model, a company must have an internal network.	☐	☐
A company can extend the computing resources of its internal network by using a hybrid cloud.	☐	☐
In a public cloud model, only guest users at your company can access the resources in the cloud.	☐	☐

Answer Area

Statements	Yes	No
To implement a hybrid cloud model, a company must have an internal network.	☐	☒
A company can extend the computing resources of its internal network by using a hybrid cloud.	☒	☐
In a public cloud model, only guest users at your company can access the resources in the cloud.	☐	☒

Correct Answer:

Box 1: No -

It is not true that a company must always migrate from an internal network to implement a hybrid cloud. You could start with a public cloud and then combine that with an on-premise infrastructure to implement a hybrid cloud.

Box 2: Yes -

A company can extend the computing resources of its internal network by using the public cloud. This is very common. When you need more resources, rather than pay out for new on-premises infrastructure, you can configure a cloud environment and connect your on-premises network to the cloud environment by using a VPN.

Box 3: No -

It is not true that only guest users can access cloud resources. You can give anyone with an account in Azure Active Directory access to the cloud resources.

There are many authentication scenarios but a common one is to replicate your on-premises Active Directory accounts to Azure Active Directory and provide access to the Azure Active Directory accounts. Another commonly used authentication method is 'Federation' where authentication

for access to cloud resources is passed to another authentication provider such as an on-premises Active Directory.

Reference:

<https://azure.microsoft.com/en-gb/overview/what-is-hybrid-cloud-computing/>

  **fuddyduddy** Highly Voted 2 years, 5 months ago

Answer is YYN
Here's why answer 1 as given is wrong. It states "It is not true that a company must always migrate from a private cloud model or must first have a private cloud to implement a hybrid cloud. You could start with a public cloud and then combine that with an on-premise infrastructure to implement a hybrid cloud."

This is true. But how can you have a hybrid with having BOTH on-prem and online infrastructure in place? Think about it - If you start with on-prem then you need to first have online infrastructure before you can be considered hybrid. And if you start online then you need to have on-prem infrastructure before you can be considered hybrid.

So you need have both first. Until then, you are either private or public but not hybrid.
upvoted 345 times

  **DJHASH786** 3 weeks, 6 days ago

No the first, explained as below

A hybrid cloud could combine a public cloud and a private cloud running on-premises or on the edge. It could also combine a public cloud with another public cloud (a.k.a., multicloud).

Hybrid models are meant to allow an organization to mix and match environments and to choose what works best for the specific applications and data. For instance, hybrid solutions are popular with companies in highly regulated industries that have strict data privacy requirements for how they store, process, and interact with their data.
upvoted 2 times

  **semauni** 4 months ago

I don't agree with your first answer. A hybrid cloud is a mixture of public and private clouds, and I don't see why the network couldn't be fully part of the public cloud. You might start out with a public cloud, and then decide that you don't want sensitive data stored there, and then purchase your own hardware for an on-premises data centre. You then connect that data centre with the public cloud using Azure, and build the rest of the networking with Azure. Why isn't this possible?
upvoted 2 times

  **VinnyMacD** 1 month, 1 week ago

The minute you bring anything to your own or private cloud setup...you need to have an internal network...so the answer it you always need an Internal Network.
upvoted 2 times

  **faza_d** 3 months, 1 week ago

The question is not about what you can start with, but about can you implement a hybrid cloud without internal network. So answer should be 'YES' on first part.

on-premises data center = internal network. So yes, you MUST have internal network to implement Hybrid cloud
upvoted 1 times

  **jojolabubu** 3 months ago

No. Hybrid just means at least 2 different networks.
So all the combinations work:

On-Premises + Public or Private
On-Premises + On-Premises (why not)
Private + Private
Public + Public (i.e. AWS + Azure)

So YYN (:
upvoted 2 times

  **jojolabubu** 3 months ago

Public + Private works too of course
upvoted 1 times

  **rafacop** 6 months ago

Agree with you.
upvoted 1 times

  **Skyblue17** 2 years ago

If a company will not have private cloud infrastructure, why company will setup it after using public cloud. Hybrid model seems implemented just to cover all the customers who are already on On-Prem and want to setup cloud environment. So as per my understanding answer of first question should be Yes.
upvoted 8 times

  **ajl22** 1 year, 8 months ago

Why after starting on public? Perhaps you're a new start-up, on public first. Then you encounter regulatory, compliance or political reasons to bring some things private.

But to *actually* implement a hybrid cloud you need the private infra, otherwise what are you connecting to?

  **Cheetaz**  2 years, 3 months ago

The book 'Microsoft Azure Fundamentals exam ref AZ-900, second edition' states:

"Important: Hybrid doesn't always include on-premises

Remember, a private cloud is a cloud dedicated to a single organization.

It doesn't have to be located on-premises.

It can also be hosted at a third-party data center, so a hybrid cloud model might be the combination of a third-party data center and a public cloud."

Which would indeed mean NYN.

upvoted 169 times

  **zimzimzima** 2 months, 3 weeks ago

Yes this makes sense.

upvoted 1 times

  **Fosnefes** 7 months, 3 weeks ago

I agree. What about Azure Dedicated Host - this is PRIVATE cloud.

upvoted 1 times

  **Okha** 7 months, 1 week ago

That is a private cluster, not exactly a private cloud

upvoted 2 times

  **log4NIC** 1 year, 6 months ago

The fact a network being internal or not, is defined by the network IPs, not by the localization of the servers. Even if a hybrid cloud model exists in your company with Private and Public Cloud (without On-Premises), that doesn't mean that there isn't an Internal Network.

upvoted 4 times

  **JpTheCloudGuy** 1 year, 12 months ago

I tend to disagree. The first answer would be "Y" as follows:

A hybrid cloud—sometimes called a cloud hybrid—is a computing environment that combines an on-premises datacenter (also called a private cloud) with a public cloud, allowing data and applications to be shared between them. Some people define hybrid cloud to include “multicloud” configurations where an organization uses more than one public cloud in addition to their on-premises datacenter.

<https://azure.microsoft.com/en-us/overview/what-is-hybrid-cloud-computing/>

upvoted 3 times

  **Bobip**  22 hours, 27 minutes ago

NYN:

A company does not necessarily need to have an internal network to implement a hybrid cloud model. A hybrid cloud model involves the integration of both on-premises infrastructure (private cloud or traditional data centers) and a public cloud environment (such as Azure, AWS, or Google Cloud). The key to implementing a hybrid cloud is the ability to establish connectivity and communication between these two environments, but this does not require a dedicated internal network.

upvoted 2 times

  **wiper** 1 month ago

But we are having question:

To implement hybrid cloud model Company must have an internal network.

If we want to connect from private to public we need to have some internal network as resurces need to be visible.

upvoted 1 times

  **Eagrob_11** 3 months, 2 weeks ago

Admin, please change the answer to YYN. It doesn't make sense to say no to Question No.1

upvoted 1 times

  **Paulifea** 3 months, 2 weeks ago

Please look up the definition of private cloud. Yes, you can host it on-premise (internal network), but you can also host it on a third-party data center (external network) that is leased EXCLUSIVELY to your organization i.e. not multi-tenant

upvoted 2 times

  **Eagrob_11** 3 months, 2 weeks ago

The answer is YYN.

In the first answer you provide you said no and you mention the company doesn't need to migrate but the question didn't mention about migration, all it says is it must have an Internal Network (On-premises), so the answer is Yes.

upvoted 1 times

  **Bookem** 3 months, 4 weeks ago

There was never a statement that there was a migration of the network. How would a Hybrid Cloud exist if there was not a Network in the Private Cloud?

upvoted 1 times

  **Bookem** 3 months, 4 weeks ago

How can a Private Cloud exist without an internal network? This question was poorly worded and too vague.

upvoted 2 times

  **raduM** 4 months ago

yyn it is necessary to have an internal network in order to implement hybrid cloud. Even if you start with public cloud, you will achieve hybrid cloud by implementing an internal network, thus internal network is required to implement hybrid cloud

upvoted 2 times

  **vale91cv** 4 months, 1 week ago

this question was in my exam - 18/05/2023

upvoted 3 times

  **Hink** 4 months, 2 weeks ago

NYN - it says "To Implement" NOT "To have", right?

upvoted 1 times

  **idjbm71** 5 months ago

I think is YYN. Private Cloud is also included in Hybrid Cloud. I don't understand this double-bar to measure from Microsoft.

upvoted 1 times

  **Nknow3** 5 months, 3 weeks ago

Yes, you typically need an internal network to implement a hybrid cloud model with Microsoft Azure. An internal network, also known as a private network or virtual private network (VPN), is used to securely connect your on-premises infrastructure with your Azure resources. to establish this connection is through Azure ExpressRoute, which provides a dedicated, private connection between your on-premises infrastructure and Azure datacenters.

upvoted 1 times

  **rafacop** 6 months ago

i'm not agree with first estatement. A company can start with a public cloud so in any case to implement a hybrid cloud they will need yes or yes a onprem model.

upvoted 1 times

  **HongTong70** 6 months, 2 weeks ago

ChatGpt said the first one is true

upvoted 3 times

  **Sean_n3** 6 months, 3 weeks ago

Yes, to implement a hybrid cloud model, a company must have an internal network.

A hybrid cloud model is a cloud computing model that combines public cloud services with a private cloud or on-premises infrastructure. In a hybrid cloud model, some applications and data are kept in the private cloud or on-premises infrastructure, while others are hosted in the public cloud.

To connect the private cloud or on-premises infrastructure to the public cloud, a secure network connection is required. This is typically achieved by setting up a Virtual Private Network (VPN) or using dedicated connections such as Azure ExpressRoute.

Therefore, to implement a hybrid cloud model, the company must have an internal network to connect its private cloud or on-premises infrastructure to the public cloud. This internal network must be secure and reliable to ensure that applications and data are protected and that the hybrid cloud solution functions properly.

upvoted 8 times

  **Desolater** Most Recent 3 days, 10 hours ago
N, N, Y.

On the second and the most discussed question:
In Azure, increasing the memory allocated to a Platform as a Service (PaaS) solution, such as an Azure App Service, is typically not achieved by changing the pricing tier. Pricing tiers for PaaS services like Azure App Service primarily affect the CPU, storage, and other resource allocations, but not the memory.

To adjust the memory allocated to an Azure PaaS service, you typically need to choose a different service plan or instance size within the same pricing tier. Azure App Service plans, for example, come in various sizes, each with a specific combination of CPU, memory, and other resources. By selecting a different service plan or instance size, you can increase or decrease the memory available to your application.

So, while changing the pricing tier can affect the overall performance and resource allocation for a PaaS solution, including CPU and storage, adjusting the memory allocation typically involves selecting the right App Service Plan or instance size within the chosen tier.

upvoted 1 times

  **Michelle_YaNan** 3 months, 3 weeks ago
NNY.
The pricing tiers in Azure PaaS services are generally based on factors like computing power, storage, and additional features provided by the service. While changing pricing tiers may offer different levels of resources such as CPU, storage, or scalability options, it does not directly provide additional memory to individual apps. The memory allocation for an application is typically determined by the chosen pricing tier or configuration settings when deploying the app. However, it's worth noting that some PaaS services in Azure do provide options to scale resources, including memory, based on the needs of the application. For example, Azure App Service, which is a PaaS offering for hosting web applications, allows you to scale up or scale out your app instances to allocate more resources, including memory, to meet the application's requirements. But this scaling is done through specific mechanisms, such as adjusting the instance size or increasing the number of instances, rather than directly changing the pricing tier.
upvoted 2 times

  **navid1365** 4 months ago
The answer is No, Yes, Yes. with PaaS you can choose a different pricing tier with more memory and processing power. So the answer to the second one is Yes.
upvoted 1 times

  **dearmichael2000** 4 months, 3 weeks ago

Answer from "Discover"
According to the current web page context, changing the pricing tier of an App Service plan that your app belongs to can provide more CPU, memory, disk space and extra features like dedicated virtual machines (VMs), custom domains and certificates, staging slots, autoscaling and more. You can scale up by changing the pricing tier of the App Service plan that your app belongs to.

Question #57

Topic 1

Your company has an on-premises network that contains multiple servers.

The company plans to reduce the following administrative responsibilities:

- ☞ Backing up application data
- ☞ Replacing failed server hardware
- ☞ Managing physical server security
- ☞ Updating server operating systems
- ☞ Managing permissions to shared documents

The company plans to migrate servers to Azure virtual machines.

You need to identify which administrative responsibilities will be eliminated after the planned migration.

Which two responsibilities should you identify? Each correct answer presents a complete solution.

NOTE: Each correct selection is worth one point.

- A. Replacing failed server hardware
- B. Backing up application data
- C. Managing physical server security
- D. Updating server operating systems
- E. Managing permissions to shared documents

Correct Answer: AC

Azure virtual machines run on Hyper-V physical servers. The physical servers are owned and managed by Microsoft. As an Azure customer, you have no access to the physical servers. Microsoft manage the replacement of failed server hardware and the security of the physical servers so you don't need to.

Incorrect Answers:

B: Microsoft have no control over the applications you run on the virtual machines. Therefore, it is your responsibility to ensure that application data is backed up.

D: Microsoft do not manage the operating systems you run on the virtual machines. Therefore, it is your responsibility to ensure that the operating systems are updated.

E: Microsoft have no control over the shared folders you host on the virtual machines. Therefore, it is your responsibility to ensure that folder permissions are configured appropriately.

Selected Answer: A

Regarding the fundamental concepts of OPEX (Ongoing Operational Expenditure) and CAPEX (Upfront Capital Expenditure), it is important to understand that obtaining an electricity connection for a data center falls under the category of CAPEX, as it involves an initial upfront investment. On the other hand, paying the electricity bill on a monthly basis for the data center is considered an example of OPEX, as it represents ongoing operational expenses. However, there seems to be some confusion regarding whether paying for electricity in relation to a data center qualifies as an example of OPEX. Can anyone in this forum who has already taken the exam and answered this question correctly provide some clarity on this matter? Your assistance would be greatly appreciated. Thank you to all the members of this forum.

Question #58

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
Azure Pay-As-You-Go pricing is an example of CapEx.	☐	☐
Paying electricity for your datacenter is an example of OpEx.	☐	☐
Deploying your own datacenter is an example of CapEx.	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
Azure Pay-As-You-Go pricing is an example of CapEx.	☐	☒
Paying electricity for your datacenter is an example of OpEx.	☐	☒
Deploying your own datacenter is an example of CapEx.	☒	☐

One of the major changes that you will face when you move from on-premises cloud to the public cloud is the switch from capital expenditure (buying hardware) to operating expenditure (paying for service as you use it).

Box 1: No -

With the pay-as-go model, you pay for services as you use them. This is Opex (Operational Expenditure), not CapEx (Captial Expenditure). CapEx is where you pay for something upfront. For example, buying a new physical server.

Box 2: No -

Paying for electricity for your own datacenter will be classed as CapEx, not OpEx.

Box 3: Yes -

Deploying your own datacenter is an example of CapEx. This is because you need to purchase all the infrastructure upfront before you can use it.

Reference:

<https://docs.microsoft.com/en-us/azure/architecture/cloud-adoption/appendix/azure-scaffold>

- alanlzp1404

upvoted 8 times
- VIP_G

1 year, 6 months ago

Well technically yes, paying electricity is an OpEx... BUT this question is tricky... I think it is No because the keywords here are "your data center". Any expense in your own data center would be classified as CapEx. That is the whole point of going to a Cloud Provider to switch all those CapEx expenses to OpEx. That is why I think it may be NO. Tricky question.

upvoted 39 times
- PDR

1 year, 4 months ago

"Any expense in your own data center would be classified as CapEx" - that is not true. CapEx is upfront, known expenditure and OpEx is ongoing expenditure that can be variable. The 'location' of these 2 is irrelevant.

Paying electricity for your own datacenter would almost certainly be a month by month fluctuating expense and would only be CapEx in

special circumstances such as some kind of pre agreement with the power supplier to pay costs up front or if you built your own power station to supply yourself!

upvoted 20 times

  **Ajay_J** 4 months, 3 weeks ago

You are overthinking it

upvoted 7 times

  **PetersAzureAccount** 11 months, 1 week ago

Nothing tricky about it. Electricity is a service that you pay for as you use it. Don't get confuse things by getting caught up in semantics. It's OpEx.

upvoted 1 times

  **Tempnick1232temp** 2 months, 3 weeks ago

While I get the confusion about the electricity being OpEx instead of CapEx, it is CapEx.

While the cost of electricity itself is an ongoing operational expense, the investment in the infrastructure required to power a datacenter is typically considered a capital investment (CapEx) since it involves purchasing and setting up the physical assets required for the operation of the datacenter.

In the case of owning and operating a datacenter, the cost of purchasing and setting up the necessary hardware, networking equipment, cooling systems, and power infrastructure is considered a CapEx. This includes the investment in electricity infrastructure and the ongoing costs associated with powering and maintaining the datacenter.

Question #60

Topic 1

To which cloud models can you deploy physical servers?

- A. private cloud and hybrid cloud only
- B. private cloud only
- C. private cloud, hybrid cloud and public cloud
- D. hybrid cloud only

Correct Answer: A

A private cloud is on-premises so you can deploy physical servers.

A hybrid cloud is a mix of on-premise and public cloud resources. You can deploy physical servers on-premises.

Reference:

<https://azure.microsoft.com/en-gb/overview/what-is-hybrid-cloud-computing/>

I am wondering, [Private CLOUD = on-premise] ?
Private cloud is one of the cloud services,
so how Private CLOUD can be equal on-premise?
I heard that CLOUD is OFF-premise (opposite on-premise)
Just let me know.

upvoted 4 times
- Benzitho

8 months, 2 weeks ago

Yep you are correct .If we use the correct wording all the answers are wrong .So then because we understand what they were trying to say ,
therefore the correct answer would be A.

upvoted 1 times
- mhanief

8 months, 3 weeks ago

Private cloud mean you build your own cloud infrastructure in your own datacenter/office/home/server room. You will need servers, storage,
network appliances etc, and you will build this infra in your own premise. and of course you need to maintain all those hardware by yourself. So
that's why we consider private cloud as on-prem. Hope I answer your question.

upvoted 1 times
- AlbertKwan

10 months, 2 weeks ago

I think private cloud can be either on-premises or off-premises.

on-premises - you host the private cloud yourself onsite.

off-premises - the cloud servers are not physically located on the grounds of the organization using them. Instead, a third party manages and
hosts the cloud remotely

Question #61

Topic 1

DRAG DROP -

Match the cloud model to the correct advantage.

Instructions: To answer, drag the appropriate cloud model from the column on the left to its advantage on the right. Each cloud model may be used once, more than once, or not at all.

NOTE: Each correct match is worth one point

Select and Place:

Cloud model**Work Area**

Hybrid Cloud

Private Cloud

Public Cloud

No required capital expenditure.

Provides complete control over security.

Provides a choice to use on-premises or cloud-based resources.

Correct Answer:**Cloud model****Work Area**

Hybrid Cloud

Private Cloud

Public Cloud

Public Cloud

Private Cloud

Hybrid Cloud

No required capital expenditure.

Provides complete control over security.

Provides a choice to use on-premises or cloud-based resources.

Box 1: Public Cloud -

With a public cloud, there is no capital expenditure on server hardware etc. You only pay for cloud resources that you use as you use them.

Box 2: Private Cloud -

A private cloud exists on premises, so you have complete control over security.

Box 3: Hybrid Cloud -

A hybrid cloud is a mix of public cloud resources and on-premises resources. Therefore, you have a choice to use either.

Question #62

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
A company can extend a private cloud by adding its own physical servers to the public cloud.	☐	☐
To build a hybrid cloud, you must deploy resources to the public cloud.	☐	☐
A private cloud must be disconnected from the internet.	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
A company can extend a private cloud by adding its own physical servers to the public cloud.	☐	☒
To build a hybrid cloud, you must deploy resources to the public cloud.	☒	☐
A private cloud must be disconnected from the internet.	☐	☒

Box 1: No -

You cannot add physical servers to the public cloud. You can only deploy virtual servers in the public cloud. You can extend a private cloud by deploying virtual servers in a public cloud. This would create a hybrid cloud.

Box 2: Yes -

A hybrid cloud is a combination of a private cloud and public cloud. Therefore, to create a hybrid cloud, you must deploy resources to a public cloud.

Box 3: No.

It is not true that a private cloud must be disconnected from the Internet. Private clouds can be and most commonly are connected to the Internet. “Private cloud” means that the physical servers are managed by you. It does not mean that it is disconnected from the Internet.

How can you Have Hybrid Cloud Without recourses on the public cloud?

upvoted 12 times
- fuddydiddy

2 years, 4 months ago

I agree N,N,N too. Here's why:
I have a tenant. I don't have any subscriptions. This means that I can't create any resources at all. (I do have a SPO web site but that is not an Azure Resource.)
But I use AAD Connect to sync some of my on-prem security principals (users and groups) to my tenant. This means that my environment is hybrid. I could even run Exchange Hybrid Configuration Wizard if I wanted.
So I have a hybrid environment without resources.

This means that you don't need to create resources in the cloud to be hybrid.

upvoted 14 times

🗨️ 👤 **Juanpnav** 6 months ago

AAD it's your resource now, you have hybrid because you already have an instance and database (resources) in azure that connect to you on-prem. Right?

upvoted 2 times

🗨️ 👤 **r3verse** 10 months ago

Depends on the definition of resources, you would be right if it's specifically resources defined under Azure Resource Manager. But resources are used more broadly in azure, for instance, they talk about Azure AD resources here: <https://learn.microsoft.com/en-us/graph/api/resources/azure-ad-overview?view=graph-rest-1.0#authorization>. Which you need for your hybrid cloud, but aren't resources as defined by Resource Manager, so then i'll lean towards NYN instead of NNN.

upvoted 2 times

🗨️ 👤 **jecaine** 2 years, 4 months ago

it says "Deploy." You can have a private and public cloud, but you don't have to deploy resources from your private cloud to the public cloud. you can add new resources that don't exist on your private cloud. For example: If John Smith exists in AD on your Domain Controller, you don't have to migrate his user record to AzureAD, you can add Susie Q separately, therefore you have a hybrid cloud but you're not deploying resources to the public cloud

upvoted 16 times

🗨️ 👤 **LPaul** 7 months ago

to answer that , basically i can just backup to cloud . can a backup also as resource?

upvoted 1 times

🗨️ 👤 **elkiel** 5 months, 1 week ago

Agree, you can build a hybrid cloud starting by a public cloud and then deploying resources to private cloud, I think it came up in a previous version.

upvoted 2 times

🗨️ 👤 **gatsbi** 2 years, 2 months ago

I agree. You wouldn't be deploying 'Resources' to public cloud. Public cloud already have resources such as Servers, OS. You would be deploying only your code and data.

upvoted 3 times

🗨️ 👤 **nicky_nyasha** 2 years, 5 months ago

I think you are right

upvoted 1 times

🗨️ 👤 **Amitkj2989** Highly Voted 👍 2 years, 7 months ago

Not sure about answer 2. You can deploy resources to private cloud as well in case of hybrid, why MUST deploy to public cloud only?

upvoted 20 times

🗨️ 👤 **TheMIsTheBest** 10 months, 1 week ago

A hybrid cloud is a computing environment that uses both public and private clouds in an inter-connected environment. A hybrid cloud environment can be used to allow a private cloud to surge for increased, temporary demand by deploying public cloud resources. Hybrid cloud can be used to provide an extra layer of security. For example, users can flexibly choose which services to keep in public cloud and which to deploy to their private cloud infrastructure.

<https://learn.microsoft.com/en-us/training/modules/describe-cloud-compute/5-define-cloud-models>

A hybrid cloud MUST have a public cloud and a private cloud (either on-premises or off-premises)

upvoted 3 times

🗨️ 👤 **Illumielle** 2 years, 7 months ago

I don't see the word "only".

upvoted 4 times

🗨️ 👤 **BabieTee** 2 years, 6 months ago

must in the sentence takes the place of only

upvoted 2 times

🗨️ 👤 **cab123** 2 years, 5 months ago

no, "must" means you have to, because you have to have something in the cloud, it does not mean "only"

upvoted 4 times

🗨️ 👤 **MIU** 2 years, 4 months ago

In case the user Already had Public Cloud only, then if he prepares on-premises servers or Private Cloud, they would be Hybrid.

So...I think No/No/No in this question.

upvoted 2 times

🗨️ 👤 **NXuser** 2 years, 3 months ago

2nd - Tricky one - Still not sure. If you already have public cloud and adding on-prem resources making it hybrid - Answer is No. But you still need to connect somehow your public and private cloud - i.e. VPN or direct MPLS. That connection is also an resource. With that in mind the answer is Yes you still need at least some "connection" resource to be deployed in Public cloud. What do you think ?

upvoted 4 times

  **NasheM** 2 years, 7 months ago

In hybrid you deploy to both public and private cloud. It doesn't say ONLY public but you have to have something deployed in public cloud, otherwise it's just private cloud not hybrid

upvoted 25 times

  **tom112** 1 year, 1 month ago

what if you already have one deployed on a public cloud, and you want to deploy another? In this case, it's already hybrid anyway, so I can deploy either in the private or public.

upvoted 1 times

  **tacobear** 1 year, 6 months ago

correct. If you don't have anything in public cloud but just in on prem then it is not hybrid. So you will need to deploy vm or an app, website (anything) in public clod to make it hybrid.

upvoted 1 times

  **JPA210** 1 year, 8 months ago

This is the best answer for me, the word 'ONLY' is the key. If it was there in the sentence, so it would be false, otherwise is is true.

upvoted 3 times

  **JBPI** 2 years, 5 months ago

I agree. My assumption based on the statement is that there is no private cloud yet. So it won't be a hybrid if this is deployed only in the public cloud.

upvoted 3 times

  **Sanzib7** Most Recent 4 weeks, 1 day ago

ok read the sentence again and again, specially this part TO BUILD A HYBRID CLOUD- read that again, you may have something in private cloud or something in public cloud but if you are making hybrid you need some resource on both places- so answer is YES

upvoted 1 times

  **LinkinTheStinkin** 1 month, 1 week ago

Does a "private cloud" have to be your data center, or
Can you purchase services through azure that would qualify as a private cloud?

upvoted 1 times

  **jojolabubu** 3 months ago

Would go for NNN
A hybrid cloud can be On-premises + Private cloud (VMWare...)

upvoted 3 times

  **Eagrob_11** 3 months, 2 weeks ago

The answer can be NNN. Source from ChatGPT:
deploying resources to the public cloud is not a requirement to create a hybrid cloud environment. In a hybrid cloud model, organizations have the flexibility to integrate and manage resources across both their private cloud and public cloud environments. So itis not a must to deploy a resource.

upvoted 1 times

  **xenmorph** 3 months, 2 weeks ago

i got no yes no from chatgpt
To build a hybrid cloud, you must deploy resources to the public cloud.
Answer: Yes

Explanation: In a hybrid cloud model, organizations utilize both private and public cloud environments. To build a hybrid cloud, resources need to be deployed in both the private and public clouds. This allows for workload mobility, resource scaling, and seamless integration between the two environments.

upvoted 1 times

  **Marcas** 4 months, 2 weeks ago

Yes, to build a hybrid cloud, you must deploy resources to both a public cloud and a private cloud. A hybrid cloud is a cloud computing environment that combines the use of both public and private clouds, allowing data and applications to be shared between them. This allows organizations to take advantage of the scalability and cost-effectiveness of the public cloud while still maintaining control and security over their sensitive data and applications in the private cloud.

upvoted 1 times

  **Froggy** 5 months ago

people who say the second question is no have a serious trust issues

upvoted 2 times

  **uciaci** 4 weeks ago

You could start out with a public cloud. And then deploy to a private DC/Cloud thus creating a Hybrid cloud. You don't need to deploy to a public cloud.

upvoted 1 times

  **zimzimzimme** 2 months, 3 weeks ago

And for a good reason:
<https://azure.microsoft.com/en-us/resources/cloud-computing-dictionary/what-is-hybrid-cloud-computing/> (here they say a private cloud is on-premise)

<https://azure.microsoft.com/en-us/resources/cloud-computing-dictionary/what-is-a-private-cloud/> (here they say a private cloud doesn't have to be on-premise)

upvoted 1 times

  **_Juliemol13** 3 months, 2 weeks ago

hahahaha

upvoted 1 times

  **Nick_Hey** 5 months ago

Answer is NO NO NO.

1) The same question was asked on a previous page and the answer was NO; to have a hybrid cloud you must deploy resources to a private network etc.

2) The second question is akin to saying "To drive a car you MUST buy a car."

upvoted 1 times

  **Kanatius** 3 months, 3 weeks ago

I cannot have a hybrid cloud without having resource deployed on public cloud. The hybrid is "public + private". To be considered Hybrid You MUST have resources deployed on public cloud.

The second is YES

upvoted 2 times

  **Taleeya** 6 months, 1 week ago

can someone who passed the exam confirm it's NNN?

upvoted 1 times

  **KiraMT** 6 months, 3 weeks ago

In N2 it doesn't say you already have private cloud, so by deploying to cloud, you still don't have two (private+public)... Not sure about the correctness. Maybe it's No...

upvoted 1 times

  **Alex4190** 7 months, 1 week ago

NO NO NO.

You don't deploy resources to public cloud to be used. You would use your on-prem deployment + Azure, not the other way around.

upvoted 1 times

  **rodrigojds** 7 months ago

I think the confusion here is the word 'resources'. Something has to be added/done to the public cloud in order for you to have a hybrid solution. Having on-prem and a private cloud isn't a hybrid solution.

upvoted 1 times

  **uciaci** 2 weeks, 3 days ago

What if you ALREADY have resoruce in a public cloud and deploy some to a private AFTERWARDS thus creating a hybrid cloud.

upvoted 1 times

  **Kanders** 7 months, 3 weeks ago

- 1. No
- 2. Yes
- 3. No

upvoted 6 times

  **nhanho_17** 7 months, 3 weeks ago

Answer is No, No, No. You don't need to deploy resources to the Public cloud to have an Hybrid environment, while you can build it just by having private and on-premises

upvoted 2 times

  **Mehe323** 2 months ago

Private is a form of on-prem. Private + on-prem is not a hybrid environment, it has to be public and private or public and on-prem.

upvoted 1 times

  **Kanatius** 3 months, 3 weeks ago

What you're saying looks like "You dont need to mix fruits and water to make a juice. Juice is just having water and fruits".

Just the fact you have a public cloud and a private cloud does not mean you have a Hybrid cloud. You have to integrate them ("make the juice"), otherwise they'd be just fruits and water

upvoted 1 times

  **rodrigojds** 7 months ago

private and on prem doesn't comprise a hybrid solution.

'What Is a Hybrid Cloud? A hybrid cloud is the integration of a public cloud with private cloud or on-premise resources. '

upvoted 1 times

  **RougePotatoe** 8 months, 1 week ago

Question 2 depends on how you interpret "you must deploy resources to the public cloud." If they mean you must have resources in the public cloud then yes. But if they mean you can only go private + public to have hybrid then no. As you can have a public + private model. As in you could have been a public cloud only infrastructure before.

upvoted 2 times

Question #63

Question #64

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area**Statements****Yes****No**

A platform as a service (PaaS) solution that hosts web apps in Azure provides full control of the operating systems that host applications.

☐☐

A Platform as a Service (PaaS) solution that hosts web apps in Azure can be provided with additional memory by changing the pricing tier.

☐☐

A Platform as a Service (PaaS) solution that hosts web apps in Azure can be configured to automatically scale the number of instances based on demand.

☐☐**Answer Area****Statements****Yes****No**

A platform as a service (PaaS) solution that hosts web apps in Azure provides full control of the operating systems that host applications.

☐☒

A Platform as a Service (PaaS) solution that hosts web apps in Azure can be provided with additional memory by changing the pricing tier.

☒☐

A Platform as a Service (PaaS) solution that hosts web apps in Azure can be configured to automatically scale the number of instances based on demand.

☒☐

Correct Answer:

Box 1: No -

A PaaS solution does not provide access to the operating system. The Azure Web Apps service provides an environment for you to host your web applications.

Behind the scenes, the web apps are hosted on virtual machines running IIS. However, you have no direct access to the virtual machine, the operating system or IIS.

Box 2: Yes -

Box 3: Yes -

A PaaS solution that hosts web apps in Azure does provide the ability to scale the platform automatically. This is known as autoscaling. Behind the scenes, the web apps are hosted on virtual machines running IIS. Autoscaling means adding more load balanced virtual machines to host the web apps.

I think that you are overthinking it.
upvoted 3 times

🗨️ 👤 **NavShett** 1 year, 6 months ago

I think MCLC2021 is right, multiple apps could be running within same PAAS via App service plan. Each can use its own memory use, so changing the pricing tier provides memory to the PAAS but not directly to the app. Refer "You can continue to add apps to an existing plan as long as the plan has enough resources to handle the load. However, keep in mind that apps in the same App Service plan all share the same compute resources." <https://docs.microsoft.com/en-us/azure/app-service/overview-hosting-plans#what-if-my-app-needs-more-capabilities-or-features>

  **Desolater** Most Recent 3 days, 9 hours ago
N, N, Y.

On the second and the most discussed question:
In Azure, increasing the memory allocated to a Platform as a Service (PaaS) solution, such as an Azure App Service, is typically not achieved by changing the pricing tier. Pricing tiers for PaaS services like Azure App Service primarily affect the CPU, storage, and other resource allocations, but not the memory.

To adjust the memory allocated to an Azure PaaS service, you typically need to choose a different service plan or instance size within the same pricing tier. Azure App Service plans, for example, come in various sizes, each with a specific combination of CPU, memory, and other resources. By selecting a different service plan or instance size, you can increase or decrease the memory available to your application.

So, while changing the pricing tier can affect the overall performance and resource allocation for a PaaS solution, including CPU and storage, adjusting the memory allocation typically involves selecting the right App Service Plan or instance size within the chosen tier.

1. NO
2. Yes
3. Yes
upvoted 2 times

  **RougePotatoe** 8 months, 2 weeks ago
The interpretation of statement 2 here depends on the correct definition of Tier. Is a change from B1 to B2 a different tier (no increase in memory)? Or are we talking about B to S change; definitely increases more memory. At least from the pricing table listed in the link it seems to suggest B to S

is a change of tier but not B1 to B2.
<https://azure.microsoft.com/en-us/pricing/details/app-service/windows/#pricing>
upvoted 2 times

  **RougePotatoe** 8 months, 2 weeks ago
Also depends on what they mean by memory. If Ram than B1 to B2 could also be an option.

Question #65

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

Your company plans to migrate all its data and resources to Azure.

The company's migration plan states that only Platform as a Service (PaaS) solutions must be used in Azure.

You need to deploy an Azure environment that meets the company migration plan.

Solution: You create Azure virtual machines, Azure SQL databases, and Azure Storage accounts.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: B

Platform as a service (PaaS) is a complete development and deployment environment in the cloud. PaaS includes infrastructure λ €" servers, storage, and networking λ €" but also middleware, development tools, business intelligence (BI) services, database management systems, and more. PaaS is designed to support the complete web application lifecycle: building, testing, deploying, managing, and updating. However, virtual machines are examples of Infrastructure as a service (IaaS). IaaS is an instant computing infrastructure, provisioned and managed over the internet.

2 years, 2 months ago

A PaaS cannot exist without a IaaS, so the answer is YES. how can I create a PaaS without creating VM's?
upvoted 8 times

  **MIHPK** 1 year, 11 months ago
you dont need VM for PaaS solution, PaaS solutions examples are Azure funtions, Azure Web apps and others.
upvoted 2 times

  **xian05** 2 years ago
Because you don't manage the VM's in PaaS, Azure/Microsoft does this -. (Not worry about updating).
In IaaS you yourself have to take care of the VM.
upvoted 2 times

  **Azuni** 1 year, 10 months ago
I also thought so, until I looked at the question carefully. I believe the question's answer has everything to do with this line:
"The company's migration plan states that ONLY Platform as a Service (PaaS) solutions must be used in Azure."
It states that only PaaS can be used and nothing else.
upvoted 2 times

Question #66

Topic 1

Your company plans to deploy several custom applications to Azure. The applications will provide invoicing services to the customers of the company. Each application will have several prerequisite applications and services installed.

You need to recommend a cloud deployment solution for all the applications.

What should you recommend?

- A. Software as a Service (SaaS)
- B. Platform as a Service (PaaS)
- C. Infrastructure as a Service (IaaS)

Correct Answer: C

Infrastructure as a service (IaaS) is an instant computing infrastructure, provisioned and managed over the internet. The IaaS service provider manages the infrastructure, while you purchase, install, configure, and manage your own software

Incorrect Answers:

A: Software as a service (SaaS) allows users to connect to and use cloud-based apps over the Internet. Common examples are email, calendaring, and office tools. In this scenario, you need to run your own apps, and therefore require an infrastructure.

B:

Platform as a service (PaaS) is a complete development and deployment environment in the cloud. PaaS includes infrastructure—servers, storage, and networking—but also middleware, development tools, business intelligence (BI) services, database management systems, and more. PaaS is designed to support the complete web application lifecycle: building, testing, deploying, managing, and updating.

 3 years, 4 months ago

I believe it should be PaaS, Can someone please confirm. My exam is in 3 days.

upvoted 39 times
-   **maximotus** 3 years, 4 months ago

I think so to. The described situation has nothing to do with runtime, middleware or the OS.
Its just about linking applications and of course the data. You could use Azure Container Insance or Azure Kubernetes Service, that are PaaS solutions, am I right?

upvoted 6 times

- Zedan12

7 months, 3 weeks ago

no it is not PaaS because the application to deploy is custom so we have to do lots of customization and we do not have full control in PaaS. So the answer in IaaS

upvoted 8 times
- RoyLightstone

3 years, 4 months ago

Hi, I also believe its PaaS. "custom applications" I believe, is the key word there...Good Luck

upvoted 5 times
- Valavan

3 years, 4 months ago

Its IaaS as its in-house developed app

upvoted 13 times
- AzureDude

3 years, 4 months ago

You can have in-house apps using PaaS. You just own the app and the data, the rest is taken care of. I don't see any requirement for managing the infrastructure/VMs, so PaaS is what I'm going with.

upvoted 15 times
- rolteame

2 years, 6 months ago

I believe the answer is IaaS because of the condition of each app having its own prerequisites

upvoted 10 times
- Klaid

2 years, 4 months ago

Exactly!

upvoted 3 times
- VIP_G

1 year, 6 months ago

I agree... I think it is PaaS... question does not state anything about specifics of the pre-requisites. I am not convinced the prerequisites are for sure 100% VMs or other IaaS services. Pre-requisites may just refer to apps dependencies. I am with you... I am sticking with PaaS

Paas is the right answer

upvoted 1 times
- Ooze

2 months ago

The link you provided disagrees with you.

upvoted 4 times
- Marcacal

4 months, 2 weeks ago

I would recommend using Platform as a Service (PaaS) for deploying the custom applications to Azure. PaaS provides a platform for developers to build, test, and deploy custom applications without having to worry about managing the underlying infrastructure. This allows developers to focus on building and deploying their applications while Azure takes care of the infrastructure management.

So the correct answer to your question is B. Platform as a Service (PaaS).

upvoted 1 times
- luckygil

7 months ago

I literally copied the questions and ask ChatGPT... and answer is PaaS

Based on the given scenario, I would recommend using Azure Kubernetes Service (AKS) to deploy the custom applications to Azure.

upvoted 5 times
- Fosnefes

7 months, 1 week ago

Selected Answer: B

Platform as a Service (PaaS) – This service provides the platform needed to build your custom app and deploy them in your infrastructure.

upvoted 1 times
- Fosnefes

7 months, 1 week ago

Ans is PaaS

Software as a Service (SaaS) – These applications are delivered over the internet and you can start using them right away.
Platform as a Service (PaaS) – This service provides the platform needed to build your custom app and deploy them in your infrastructure.
Infrastructure as a Service (IaaS) – In this service, you rent all the infrastructure required by your organization such as virtual servers, storage, operating systems, and more.

  **UKLscat** 8 months, 2 weeks ago
The question "Each application will have several prerequisite applications and SERVICES installed." ==> Ans is IaaS
upvoted 1 times

  **xinting** 8 months, 3 weeks ago
B.
As stated <https://azure.microsoft.com/en-in/resources/cloud-computing-dictionary/what-is-paas/> "You manage the applications and services you develop" and "Common PaaS scenarios
Organizations typically use PaaS for these scenarios:

Development framework. PaaS provides a framework that developers can build upon to develop or customize cloud-based applications. Similar to the way you create an Excel macro, PaaS lets developers create applications using built-in software components. Cloud features such as scalability, high-availability, and multi-tenant capability are included, reducing the amount of coding that developers must do.

Analytics or business intelligence. Tools provided as a service with PaaS allow organizations to analyze and mine their data, finding insights and patterns and predicting outcomes to improve forecasting, product design decisions, investment returns, and other business decisions.

Additional services. PaaS providers may offer other services that enhance applications, such as workflow, directory, security, and scheduling."
upvoted 2 times

  **mhanief** 8 months, 3 weeks ago

Question #67

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
Building a data center infrastructure is an example of operational expenditure (OpEx) costs.	☐	☐
Monthly salaries for technical personnel are an example of operational expenditure (OpEx) costs.	☐	☐
Leasing software is an example of operational expenditure (OpEx) costs.	☐	☐

Answer Area

Statements	Yes	No
Building a data center infrastructure is an example of operational expenditure (OpEx) costs.	☐	☒
Monthly salaries for technical personnel are an example of operational expenditure (OpEx) costs.	☒	☐
Leasing software is an example of operational expenditure (OpEx) costs.	☒	☐

Correct Answer:

Box 1: No -

Building a data center infrastructure is capital expenditure, not operation expenditure.

Box 2: Yes -

OpEx is ongoing costs (costs of operations) such as staff salaries.

Box 2: Yes -

OpEx is ongoing costs (costs of operations) such as leasing software. If you purchased software as a one-off purchase, that would be CapEx, but leasing software is ongoing so it's OpEx.

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area		
	Statements	YesNo
	You can create a resource group inside of another resource group.	
	An Azure virtual machine can be in multiple resource groups.	
	A resource group can contain resources from multiple Azure regions.	

Correct Answer:

Answer Area

	Statements	YesNo
	You can create a resource group inside of another resource group.	
	An Azure virtual machine can be in multiple resource groups.	
	A resource group can contain resources from multiple Azure regions.	

Box 1: No -

Box 2: No -
Each resource can exist in only one resource group.

Box 3: Yes -
Resources from multiple different regions can be placed in a resource group. The resource group only contains metadata about the resources it contains.

  **Sarmad_Mansour** 8 months, 2 weeks ago

Answers are correct.
FYI: Azure Cosmos is Serverless, this was updated by MS December 2022

Article
12/22/2022
APPLIES TO: NoSQL MongoDB Cassandra Gremlin Table

The Azure Cosmos DB serverless offering lets you use your Azure Cosmos DB account in a consumption-based fashion. With serverless, you're only charged for the Request Units (RUs) consumed by your database operations and the storage consumed by your data. Serverless containers can serve thousands of requests per second with no minimum charge and no capacity planning required.

This is the URL:
<https://learn.microsoft.com/en-us/azure/cosmos-db/serverless>
upvoted 1 times

  **Losha** 7 months, 2 weeks ago
I think "Azure Cosmos DB serverless" and "Azure Cosmos DB" are different things.
upvoted 2 times

  **kazan** 8 months, 3 weeks ago
SQL Server on Azure VM falls into the industry category Infrastructure-as-a-Service (IaaS) and allows you to run SQL Server inside a fully managed virtual machine (VM) in Azure.
NYN
upvoted 1 times

  **Tstar** 9 months, 1 week ago
Azure Cosmos DB is a fully managed platform-as-a-service (PaaS). To begin using Azure Cosmos DB, create an Azure Cosmos DB account in an Azure resource group in your subscription. You then create databases and containers within the account.

Question #73

Topic 1

Your company plans to migrate all its data and resources to Azure.

The company's migration plan states that only Platform as a Service (PaaS) solutions must be used in Azure.

You need to deploy an Azure environment that meets the company's migration plan.

What should you create?

- A. Azure virtual machines, Azure SQL databases, and Azure Storage accounts.
- B. an Azure App Service and Azure virtual machines that have Microsoft SQL Server installed.
- C. an Azure App Service and Azure SQL databases.
- D. Azure storage accounts and web server in Azure virtual machines.

Correct Answer: C

Azure App Service and Azure SQL databases are examples of Azure PaaS solutions. Therefore, this solution does meet the goal.

escflow

2 months ago

Why is this not A?

The question states "You need to DEPLOY an Azure environment", so you need to create a brand new Azure environment for the company's data and resources.

In that case would you not have to CREATE a VM, SQL database and storage accounts to prepare for the company's data and resources to be moved?

And only after creating the VM, sure the VM is managed by Azure since company wants a PaaS solution (but again, no mention of who is managing the resources)
upvoted 1 times

escflow

2 months ago

I am wrong. It's C. Because the company states only PaaS should be used. And PaaS is about a company managing their own 'Data & Access' and 'Applications', everything else will be managed by Azure.

Question #74

Topic 1

What does a customer provide in a software as a service (SaaS) model?

- A. application data
- B. data storage
- C. compute resources
- D. application software

Correct Answer: A

SaaS provides a complete software solution which you purchase on a pay-as-you-go basis from a cloud service provider. You rent the use of an app for your organization and your users connect to it over the Internet, usually with a web browser. All of the underlying infrastructure, middleware, app software and app data are located in the service provider's data center. The service provider manages the hardware and software and with the appropriate service agreement, will ensure the availability and the security of the app and your data as well.

Azure Files is not an example of Infrastructure as a Service (IaaS). Azure Files is a cloud-based file sharing service provided by Microsoft Azure, which falls under the category of Platform as a Service (PaaS).

upvoted 2 times
- Kunjuvava

2 months, 2 weeks ago

2)Yes, that is correct. A DNS server running on Azure virtual machines (VMs) is an example of Infrastructure as a Service (IaaS).

upvoted 4 times
- Harry28731

1 year, 9 months ago

Azure file is STORAGE thus Infrastructure Component...Offered as a Service ! So IaaS.

IaaS = VMs a wrong shortcut. Infrastructure encompasses Network, Storage, Compute, Infrastructure Security and Remote accesses.

It's even the first line :

Infrastructure as a service (IaaS) is a type of cloud computing service that offers essential compute, storage, and networking resources on demand, on a pay-as-you-go basis. IaaS is one of the four types of cloud services, along with software as a service (SaaS), platform as a service (PaaS), and serverless.

<https://azure.microsoft.com/en-us/overview/what-is-iaas/>
upvoted 26 times

  **valid_case** 5 months, 3 weeks ago
Azure Files is a PaaS (platform-as-a-service) offering provided by Microsoft Azure that is built on top of Azure Storage. It provides fully managed file shares over a protocol you know and love, SMB (Server Message Block)
upvoted 4 times

  **Kanatius** 3 months, 3 weeks ago
No, Azure Files is IaaS

<https://learn.microsoft.com/en-gb/training/azure-fundamentals/intro-to-azure-fundamentals/media/azure-services-6c41a736.png>
upvoted 8 times

  **aleksei89123** 1 year, 9 months ago
Azure file shares can be created without the need to manage hardware or an OS. This means you don't have to deal with patching the server OS with critical security upgrades or replacing faulty hard disks.
<https://docs.microsoft.com/en-us/azure/storage/files/storage-files-introduction>
So, Azure files is PaaS with no doubts
upvoted 15 times

  **GetulioJr** 1 year, 7 months ago
It is under Compute. It is still IaaS. :)
upvoted 4 times

  **VjAlpha** 5 months, 4 weeks ago
It clearly says Azure files is fully managed and no OS updates are needed. Files is PaaS - <https://learn.microsoft.com/en-us/azure/storage/files/storage-files-introduction>
upvoted 3 times

I think your interpretation of the line you quoted is incorrect: not everything that's Compute or Networking is IaaS. Services under Serverless Computing for example, are computing services but they are PaaS. Same thing with Container Services or VM Scale Sets.

And to quote Microsoft: "Like IaaS, PaaS includes infrastructure—servers, storage, and networking—but also middleware, development tools, business intelligence (BI) services, database management systems, and more."

<https://azure.microsoft.com/en-us/overview/what-is-paas/>

However - all Storage services do indeed appear as IaaS (look the image):

<https://docs.microsoft.com/en-gb/learn/modules/intro-to-azure-fundamentals/tour-of-azure-services>
upvoted 9 times

  **semauni** 4 months ago
I agree with Azure files being PaaS. In this video from Microsoft, Azure Storage is explicitly listed as PaaS: <https://learn.microsoft.com/en-us/training/modules/azure-networking-fundamentals/azure-virtual-network-fundamentals>
upvoted 2 times

  **Ace_Defective** Highly Voted  1 year, 12 months ago
Okay, this one is a pain the a\$\$\$. My initial thought was NNY but that is wrong. I'd go with YNY now. Somebody will have to do a better explanation on why the second is Yes for me to change that answer.

1. Azure Files is an example of infrastructure as a service. We can see this by following this link:
https://azure.microsoft.com/en-us/overview/what-is-azure/iaas/?OCID=AID2200277_SEM_4f474f37105d10e7fe342e7811e71afe:G:s&ef_id=4f474f37105d10e7fe342e7811e71afe:G:s&msclkid=4f474f37105d10e7fe342e7811e71afe#products

And going to the storage services link. We can see that yes, Azure Files is considered as Infrastructure as a Service.

I am sticking with N as DNS server on an AZURE VM is Infrastructure. You can google and you'll see references also to DNS set up as IaaS. You google DNS PaaS and you get zero, zilch.

Microsoft Intune is totally Software as a Service. If you studied for the Microsoft 365 Fundamentals then this a give me.
upvoted 98 times

  **VIP_G** 1 year, 6 months ago
I think it is YNY. The 1st one for sure is IaaS. Files is IaaS type of storage. DNS server is running on VM so leaning towards IaaS, which is why I say this is NO. and everyone agrees the last one is Y (no question here on this answer).
upvoted 7 times

  **Hoeishetmogelijk** 8 months, 3 weeks ago
You are completely right! I indeed see Azure Files mentioned on the page that opens when you click on the "Storage" link.
upvoted 1 times

  **Hoeishetmogelijk** 8 months, 1 week ago

And for the second see this page: [https://www.poweradmin.com/blog/dns-in-the-cloud-solid-or-not/#:~:text=DNS%20in%20the%20cloud%20is,a%20Service%20\(IaaS\)%20solution.](https://www.poweradmin.com/blog/dns-in-the-cloud-solid-or-not/#:~:text=DNS%20in%20the%20cloud%20is,a%20Service%20(IaaS)%20solution.)
Stating: "DNS in the cloud is generally considered to be an Infrastructure as a Service (IaaS) solution."
upvoted 2 times

  **Hoeishetmogelijk** 8 months, 1 week ago
So I think the answer is: Y - N - Y
upvoted 4 times

  **gauloises22** 8 months, 1 week ago
Also, as with many other questions, anything "on an Azure VM" indicates that you need to deploy this VM, otherwise it won't be mentioned, so that alone indicates IaaS. DNS, like Intune, as standalone services (no hint about background infrastructure) are SaaS
upvoted 1 times

  **Anindya1994** 1 year, 10 months ago
Azure files and storage both are PAAS

Storage account are not PAAS
<https://azure.microsoft.com/en-us/overview/what-is-paas/>
upvoted 3 times

  **hebbo777** 8 months, 3 weeks ago
its really tricky and confusion question, read this sentence from your above link
"Like IaaS, PaaS includes infrastructure—servers, storage, and networking—but also middleware, development tools, business intelligence (BI) services, database management systems, and more. PaaS is designed to support the complete web application lifecycle: building, testing, deploying, managing, and updating."
Hence PaaS has Server,storage + middleware tools

although in picture of services the storage was under IaaS!!

upvoted 1 times

  **wedie1021** 3 days, 6 hours ago
Azure Files is a PaaS (platform-as-a-service) offering provided by Microsoft Azure that is built on top of Azure Storage. It provides fully managed file shares over a protocol known as SMB.1 Azure Files is a cloud storage service that allows Windows Server administrators to access Server-Messsage-Block-Protocol (SMB) shares in the Azure cloud by setting up file shares in the Azure management console.4 According to some sources, Azure Storage is considered a PaaS solution since it does not require the management of OS updates, load balancing, performance allocation, etc.3 Azure Storage is the foundation for Windows and Linux Azure Virtual Machines and can support large distributed applications.2 Azure PaaS is a deployment and development environment that delivers simple cloud-based apps to complex, cloud-enabled applications.0

Answer will be NO, No , Yes

As Azure file is Paas
If Dns server is running on custom VM (vm it self is iaas) then it became laas
And Intune is software for managing server , database and all endpoints.
upvoted 2 times

  **RajgopalG** 4 weeks, 1 day ago
Azure files is IAAS. --> It is actually part of the Azure Storage service, which falls under the category of Infrastructure as a Service (IaaS).
DNS server on Azure VM is IaaS. a DNS server running on a VM would fall under the IaaS model.
Ans: NNY
upvoted 1 times

  **kejo2** 1 month, 1 week ago
This is from ChatGpt
is Azure Files PAAS or IAAS
ChatGPT
Azure Files is a Platform as a Service (PaaS) offering provided by Microsoft Azure. It's a managed file storage service that allows you to create and manage shared file storage that can be accessed using the standard Server Message Block (SMB) protocol or the Network File System (NFS) protocol. As a PaaS offering, Azure Files abstracts much of the underlying infrastructure management, such as hardware and operating system maintenance, allowing you to focus more on using the storage service itself rather than managing the underlying infrastructure.

Interesting point from ChatGPT regarding Azure Files:

It's important to note that while Azure Files is a PaaS service, it can be utilized in both IaaS (Infrastructure-as-a-Service) and PaaS scenarios. You can

mount Azure Files shares on Azure VMs, which makes it useful for IaaS scenarios where you require shared file storage across multiple VMs. Additionally, you can also access Azure Files shares from PaaS services like Azure App Service or Azure Functions.

Question #78

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
A company can extend an internal network by adding its own physical servers to the public cloud.	☐	☐
A private cloud must be disconnected from the internet.	☐	☐
Part of a hybrid cloud is the public cloud.	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
A company can extend an internal network by adding its own physical servers to the public cloud.	☐	☒
A private cloud must be disconnected from the internet.	☐	☒
Part of a hybrid cloud is the public cloud.	☒	☐

Box 1: No -

You cannot add physical servers to the public cloud. You can only deploy virtual servers in the public cloud. You can extend a private cloud by deploying virtual servers in a public cloud. This would create a hybrid cloud.

Box 2: No -

A private cloud exists in cyberspace and is accessed via the internet.

Box 3: Yes.

- Sandip_Bhandari

Most Recent

2 weeks ago

Yes, a company can extend its internal network into the public cloud by adding its own physical servers or virtual machines (VMs) hosted in the public cloud. This approach is often referred to as "hybrid cloud" or "cloud extension."

No, a private cloud does not have to be disconnected from the internet. Whether a private cloud is connected to the internet or not depends on the organization's specific requirements and security policies.

Yes, that's correct. In a hybrid cloud environment, one of the key components is the public cloud. A hybrid cloud is a computing environment that

combines on-premises or private cloud resources with public cloud resources provided by cloud service providers like Amazon Web Services (AWS), Microsoft Azure, or Google Cloud Platform (GCP).

upvoted 1 times

  **dkaps06** 1 month ago

You simply can't add physical servers to the public cloud, no matter how hard you try :)

upvoted 1 times

  **jojolabubu** 3 months ago

I'll go for NNN

On-premises + Private = Hybrid

Private x + Private y = Hybrid

And btw not the question but worth to be mentioned:

Public (Azure...) + Public (AWS) = Hybrid

Question 1: At <https://azure.microsoft.com/de-de/services/virtual-machines/dedicated-host/#features> it says, that "Azure Dedicated Hosts" are "your own private cloud in Azure". So shouldn't it be: YNY?

upvoted 2 times

  **adsjflkadsj** 1 year, 7 months ago

"Azure Dedicated Host provides physical servers that host one or more Azure virtual machines. Your server is dedicated to your organization and workloads—capacity isn't shared with other customers. This host-level isolation helps address compliance requirements. As you provision the host, you gain visibility into and control over the placement of your Azure VMs, and you determine the host's maintenance policies."

I think you are not "adding your own server" to the cloud, Azure just dedicated a separated server for you.

upvoted 1 times

-   **az_abhishek** 1 year, 8 months ago

Image result for a company can extend an internal network by adding its own physical servers to the public cloud
A company can extend the capacity of its internal network by using the public cloud. This is very common. When you need more capacity, rather than pay out for new on-premises infrastructure, you can configure a cloud environment and connect your on-premises network to the cloud environment by using a VPN.

Answer is YNY
upvoted 6 times
-   **sdokmak** 1 year, 6 months ago

You misunderstood. You can dedicate your own physical server for a private cloud but not for Azure's public cloud.

upvoted 6 times
-   **tacobear** 1 year, 6 months ago

correct, it says adding server to the public cloud. You cannot add your physical server to the cloud . So it is no

upvoted 3 times
-   **fremadse** 1 year, 8 months ago

Totally agree, must be YNY, the only way it should be now is that you were trying to extend a private cloud by adding their servers to the cloud, which obvioulsy is not possible :)

upvoted 18 times
- samcooldude1430

3 months, 2 weeks ago

it's worth noting that certain cloud deployment models, such as hybrid cloud or private cloud, may provide options for connectivity that are not solely reliant on the public internet. For example, a hybrid cloud deployment might involve a dedicated private network connection (such as a virtual private network or leased line) between your on-premises infrastructure and the cloud provider's data center. This dedicated connection can offer enhanced security, reliability, and performance compared to relying solely on the public internet.

What about a private cloud with my own intranet? Is this not also cloud computing without an internet connection?
upvoted 5 times

  **fphaneuf** 8 months, 2 weeks ago
I don't agree with answer for Box 2 since you are not forced to publish public IP addresses for the internet. So you can definitely use express Route which is a selling point from Microsoft to achieve better security
upvoted 1 times

  **acamposj** 9 months, 2 weeks ago
Creo que depende de si especificara si se tratan de nubes publicas o privadas. Yo diría NNN, incluso la pregunta 3, si es una nube privada el coste sería el mismo que un centro de datos
upvoted 1 times

  **Ghospel** 9 months, 2 weeks ago
NNY, You can use private (on-prem) cloud computing without internet connectivity
upvoted 4 times

  **osakachan** 9 months, 3 weeks ago
You can use ExpressRoute to Azure Cloud doe Q2 is No.
upvoted 1 times

  **alashi** 10 months, 1 week ago
No-No-Yes

Reason for number 2 being NO is: Azure Express Route is a direct connection from on prem network to cloud.. no traffic passes over the internet.
upvoted 1 times

Question #80

Topic 1

DRAG DROP -

Match the cloud computing benefits to the correct descriptions.

To answer, drag the appropriate benefit from the column on the left to its description on the right. Each benefit may be used once, more than once, or not at all.

NOTE: Each correct match is worth one point.

Select and Place:

Answer Area

Benefits

Agility		Resources can be provisioned dynamically to meet changing demands.
Geo-distribution		Applications and data can be deployed to multiple regions.
Scalability		Applications can be developed, tested, and launched rapidly.

Answer Area

Benefits

Correct Answer:	Agility	Scalability	Resources can be provisioned dynamically to meet changing demands.
	Geo-distribution	Geo-distribution	Applications and data can be deployed to multiple regions.
	Scalability	Agility	Applications can be developed, tested, and launched rapidly.

  **kamal_004** Highly Voted 11 months, 3 weeks ago

It's Disaster Recovery for me.

If Fault Tolerance is the ability to continue operating without interruption, Disaster Recovery commits to moving the VM from the secondary site

and bringing it online. You need to perform the "failover/failback" operation that takes around 8 to 10 minutes to complete. See: <https://learn.microsoft.com/en-us/azure/site-recovery/failover-failback-overview-modernized>

upvoted 1 times

upvoted 2 times

  **Pallierter** 1 month, 1 week ago

According to chatgpt:

Azure Site Recovery provides both fault tolerance and disaster recovery capabilities. It's a comprehensive solution that enables organizations to ensure business continuity in the face of both planned and unplanned outages.

Fault Tolerance: Azure Site Recovery helps with fault tolerance by allowing you to replicate your workloads running on on-premises servers, VMs, or other cloud platforms to Azure. This enables you to have a standby environment in Azure, ready to take over in case your primary site or infrastructure experiences a failure. This kind of setup improves the availability and resilience of your applications.

Disaster Recovery: Azure Site Recovery is primarily designed for disaster recovery scenarios. It enables you to replicate and recover your workloads in the event of a major disaster that affects your primary datacenter or infrastructure. This includes scenarios such as natural disasters, hardware failures, datacenter outages, or even human errors.

So I guess they're both right...

upvoted 2 times

  **jprentice** 1 month, 3 weeks ago

Fault Tolerance. You're moving your VM workload from one site to another for planned and unplanned outages to minimize downtime.

Read the example in the second paragraph:

<https://learn.microsoft.com/en-us/archive/msdn-magazine/2015/september/microsoft-azure-fault-tolerance-pitfalls-and-resolutions-in-the-cloud>

A portion of what Disaster Recovery is also deals with data recovery - Azure Site Recovery only handles moving your workload from one site to another. Azure Backup handles data backups and recovery.

upvoted 2 times

  **Vibhu123** 2 months ago

Azure Site Recovery provides resilience and disaster recovery for apps and workloads running on on-premises machines, or Azure IaaS VMs. Site Recovery orchestrates replication, and handles failover to Azure when outages occur.

<https://learn.microsoft.com/en-us/azure/site-recovery/vmware-azure-about-disaster-recovery>

upvoted 1 times

  **cybwear** 4 months, 2 weeks ago

This question is a bit ambiguous. ChatGPT says "Azure Site Recovery is a disaster recovery solution that provides fault tolerance". Still, I think I'll go for much simpler answer = Disaster Recovery.

upvoted 1 times

  **Sashko90** 5 months, 1 week ago

Azure Site Recovery is a disaster recovery solution that helps you protect important applications by coordinating the replication and recovery of private clouds across data centers¹. It offers ease of deployment, cost effectiveness, and dependability⁵. Some of its features include virtual machine backups, which makes virtual machine (VM) copies of your system and stores them in different regions², and asynchronous replication of data every 30 seconds which translates to RPOs of less than a minute

upvoted 2 times

  **Marcello2023** 5 months, 2 weeks ago

Azure Site Recovery provides resilience and disaster recovery for apps and workloads running on on-premises machines, or Azure IaaS VMs

  **kqureshi** 6 months, 3 weeks ago

It should be fault tolerance I believe.

"Azure Site Recovery offers ease of deployment, cost effectiveness, and dependability. Deploy replication, failover, and recovery processes through Site Recovery to help keep your applications running during planned and unplanned outages."

upvoted 1 times

  **zhihao** 7 months ago

Disaster Recovery from chatGTP

Azure Site Recovery provides disaster recovery for virtual machines. It is a cloud-based service that allows you to replicate workloads running on physical or virtual machines (VMs) from a primary site to a secondary location. In the event of an outage, you can fail over to the secondary location and continue operations with minimal downtime.

Azure Site Recovery provides a range of disaster recovery capabilities, including replication, failover, failback, and orchestrated recovery. It supports a variety of scenarios, including Azure VMs, Hyper-V VMs, and VMware VMs running on-premises or in other clouds.

Fault tolerance, on the other hand, refers to the ability of a system to continue operating in the event of a hardware or software failure. While Azure Site Recovery can help you recover from a disaster or outage, it does not provide fault tolerance for virtual machines. To achieve fault tolerance, you may need to consider other technologies such as clustering or load balancing.

Question #82

Topic 1

HOTSPOT -

You plan to use Azure to host two apps named App1 and App2. The apps must meet the following requirements:

- ☞ You must be able to modify the code of App1.
- ☞ Administrative effort to manage the operating system of App1 must be minimized.
- ☞ App2 must run interactively with the operating system of the server.

Which type of cloud service should you use for each app? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

App1:

▼

Infrastructure as a service (IaaS)

Platform as a service (PaaS)

Software as a service (SaaS)

App2:

▼

Infrastructure as a service (IaaS)

Platform as a service (PaaS)

Software as a service (SaaS)

Answer Area

Correct Answer:

App1:

▼

Infrastructure as a service (IaaS)

Platform as a service (PaaS)

Software as a service (SaaS)

App2:

▼

Infrastructure as a service (IaaS)

Platform as a service (PaaS)

Software as a service (SaaS)

Box 1: Azure Platform as a service (PaaS)

Organizations typically use PaaS for these scenarios:

Development framework. PaaS provides a framework that developers can build upon to develop or customize cloud-based applications. Similar to the way you create an Excel macro, PaaS lets developers create applications using built-in software components. Cloud features such as scalability, high-availability, and multi-tenant capability are included, reducing the amount of coding that developers must do.

SaaS

PaaS

IaaS

Hosted applications/apps

Development tools, database management, business analytics

Operating systems

Servers and storage

Networking firewalls/security

Data center physical plant/building

Box 2:

Software as a service (SaaS) allows users to connect to and use cloud-based apps over the Internet. Common examples are email, calendaring, and office tools (such as Microsoft Office 365).

SaaS provides a complete software solution that you purchase on a pay-as-you-go basis from a cloud service provider. You rent the use of an app for your organization, and your users connect to it over the Internet, usually with a web browser. All of the underlying infrastructure,

middleware, app software, and app data are located in the service provider's data center. The service provider manages the hardware and software, and with the appropriate service agreement, will ensure the availability and the security of the app and your data as well. SaaS allows your organization to get quickly up and running with an app at minimal upfront cost.

I think App2 should be IaaS. The key word in here is "Operating System"
upvoted 62 times
- Pallierter**

Most Recent

1 month ago

App1:

You must be able to modify the code of App1, which implies a need for control over the operating system and software stack. Administrative effort to manage the operating system of App1 must be minimized, indicating a desire for platform management. Therefore, for App1, you should use Platform as a Service (PaaS). PaaS allows you to focus on your application code while abstracting away the underlying operating system management.
App2:

App2 must run interactively with the operating system of the server, which implies that you need direct access to and control over the operating system.
In this case, you should use Infrastructure as a Service (IaaS). IaaS provides virtual machines (VMs) where you have full control over the operating system and can run applications interactively with it.
So, the recommended cloud service types are:

App1: PaaS
App2: IaaS

upvoted 2 times
- jprentice**

1 month, 3 weeks ago

I think App2 should be IaaS.
The question states that you are using Azure to HOST 2 apps. This makes me think these are custom apps that the company is moving to Azure.

Secondly, there is no reason to bring up OS in a SaaS or PaaS solution scenario as the OS is abstracted in those service models. The usage of "interactively" is also confusing as any application you run will interact with the OS in some way; bringing this up makes it seem like a specific OS is required for the app.

If that is the case, IaaS is the answer for App2, as you will need to run and host it on a VM with a specific OS that the user installs and maintains.

App1 - PaaS
App2 - IaaS
CHATGPT:
Based on the requirements, the appropriate cloud service types for each app would be:

App1: Azure App Service (PaaS)
App2: Azure Virtual Machine (IaaS)
Explanation:

Azure App Service (PaaS) is a fully managed platform for building, deploying, and scaling web apps. It abstracts away the underlying operating system, so administrative effort to manage the operating system of the app is minimized. Additionally, with Azure App Service, you can easily modify the code of the app without having to worry about managing the underlying infrastructure.

On the other hand, Azure Virtual Machine (IaaS) provides a fully customizable virtual machine environment, allowing you to run interactive applications that require direct access to the operating system of the server. You have full control over the operating system and can install and configure any software needed to run the application.

Therefore, based on the given requirements, App1 can be hosted on Azure App Service (PaaS), and App2 can be hosted on Azure Virtual Machine (IaaS).

Regenerate response
upvoted 14 times

  **viktornm** 7 months ago
Based on the requirements, the recommended solution for App1 is Platform as a Service (PaaS) and for App2 is Infrastructure as a Service (IaaS).

Explanation:

For App1: PaaS is the best fit for hosting App1 as it allows developers to modify the code of their applications while minimizing the administrative effort required to manage the operating system. Azure offers various PaaS services such as Azure App Service, Azure Functions, and Azure Container Instances that can be used to host App1.
For App2: IaaS is the best fit for hosting App2 as it allows running applications interactively with the operating system of the server. In IaaS, the entire virtual machine including the operating system is managed by the user, providing more control over the environment. Azure offers various IaaS services such as Azure Virtual Machines, Virtual Machine Scale Sets, and Azure Kubernetes Service that can be used to host App2.
upvoted 4 times

Question #83

Topic 1

You have an accounting application named App1 that uses a legacy database.
You plan to move App1 to the cloud.
Which service model should you use?

- A. platform as a service (PaaS)
- B. infrastructure as a service (IaaS)
- C. software as a service (SaaS)

Correct Answer: B

Cloud Infrastructure-based Applications “It moves your existing on-premises apps to the Infrastructure as a Service (IaaS) platform or re-hosts them. “Lift & Shift” is a common term for this type of relocation. The programs will be nearly identical to what they were before, but they will now be able to run on cloud VMs.

I assume It should be Paas as it deals with DB

upvoted 20 times
- zimzimzimma**

3 months, 3 weeks ago

They keyword is 'legacy' here. It implies a database is being used which Microsoft does not offer (anymore) as a PaaS service. So it must be IaaS.

upvoted 3 times
- Sarmad_Mansour**

8 months, 1 week ago

It would be PaaS if we are dealing with SQL DB, but regular DB would be IaaS.

upvoted 2 times
- matrixler**

11 months, 4 weeks ago

i think that's wrong because using PaaS you don't have full control over the operating system and you can't install your "legacy DB". So you need IaaS.

One solution would be to use a new DB within azure - that would be PaaS.

upvoted 13 times
- AlbertKwan**

10 months, 2 weeks ago

Please provide the basis of your "Assumption".

upvoted 4 times
- Sid_urooj**

Most Recent

7 months ago

App1 to the cloud is infrastructure as a service (IaaS).

The reason for this is that IaaS allows you to have greater control over the operating system, networking, and other infrastructure components, which is important when you're working with legacy applications. With IaaS, you can still use your legacy database and other existing components, while taking advantage of the scalability and cost savings offered by cloud infrastructure.

Platform as a service (PaaS) and software as a service (SaaS) are not ideal for legacy applications as they may require extensive modifications to the code or may not be compatible with the existing infrastructure. PaaS may be suitable if the application can be easily refactored or modernized to work on a new platform, while SaaS is most appropriate for applications where you don't have control over the underlying infrastructure or code.

upvoted 4 times
- viktornm**

7 months ago

B. infrastructure as a service (IaaS) is the correct service model for moving App1 to the cloud because it requires access to a specific operating system and database environment. IaaS provides the flexibility to host legacy applications and databases without having to make changes to the

underlying architecture. With IaaS, you can manage the infrastructure and the application while the cloud provider manages the underlying hardware.

Selected Answer: B

IaaS is the right one

upvoted 3 times

🗨️ 👤 **Luansi** 9 months ago

Selected Answer: A

You can move your app to a PaaS service and use a data gateway to connect with your data or migrate the entire solution (App + Database) in a VM (IaaS).

I think the solution is PaaS because the sentence only refers to the app.

upvoted 2 times

🗨️ 👤 **Altheus** 10 months, 1 week ago

Legacy database = infrastructure, it will want a Windows server to sit on.

upvoted 3 times

🗨️ 👤 **pheonix__85** 10 months, 2 weeks ago

The question indicates that only the app is migrating to the cloud, at that point nothing suggests that the DB would follow.

So assuming only the app is concerned by the migration to cloud, PaaS is a logical answer

upvoted 9 times

🗨️ 👤 **zzMichielzz** 11 months, 1 week ago

You have to read this very carefully. It only states that the APP is being moved to the Cloud. There is no indication in this text that the database must be moved or must be installed on a VM as well.

So the APP is PaaS.

(And yes, separated from this question. A Hybrid Cloud is probably needed)

upvoted 9 times

🗨️ 👤 **Pinha** 8 months, 2 weeks ago

Really good review! Congrats!

upvoted 1 times

🗨️ 👤 **wazmac** 10 months, 3 weeks ago

Very good point, the question does not say anything about moving the Legacy DB to the cloud, or installing anything, the answer is PaaS.

upvoted 3 times

🗨️ 👤 **wabosi** 10 months, 3 weeks ago

This is what #85 says, a web app and on-prem db (Hybrid).

This is actually what I thought about this scenario...the only difference with #85 might be considering the app legacy as well (and not a web app) so IaaS makes sense because you move both.

upvoted 1 times

🗨️ 👤 **Hari_kg** 11 months, 2 weeks ago

Guys I'm not sure about the answer. They are talking about moving just the app from legacy db (db unsuitable for modern apps) to cloud, not the db. So the answer should be PaaS right? Please correct me if I'm wrong.

configuring the SaaS solution	

Answer Area

Correct Answer: When you are implementing a Software as a Service (SaaS) solution, you are responsible for

	▼
configuring high availability	
defining scalability rules	
installing the SaaS solution	
configuring the SaaS solution	

Box: configuring the SaaS Solution

Software as a service (or SaaS) is a way of delivering applications over the Internet as a service. Instead of installing and maintaining software, you simply access it via the Internet, freeing yourself from complex software and hardware management.

SaaS applications are sometimes called Web-based software, on-demand software, or hosted software. Whatever the name, SaaS applications run on a SaaS provider's servers. The provider manages access to the application, including security, availability, and performance.

Question #86

Topic 1

HOTSPOT -

Select the answer that correctly completes the sentence.

Hot Area:

Answer Area

A Microsoft SQL Server database that is hosted in the cloud and has software updates managed by Azure is an example of

- disaster recovery as a service (DRaaS).
- infrastructure as a service (IaaS).
- platform as a service (PaaS).
- software as a service (SaaS).

Answer Area**Correct Answer:**

A Microsoft SQL Server database that is hosted in the cloud and has software updates managed by Azure is an example of

- disaster recovery as a service (DRaaS).
- infrastructure as a service (IaaS).
- platform as a service (PaaS).
- software as a service (SaaS).

Box: Platform as a service (PaaS)

Platform as a service (PaaS) is a complete development and deployment environment in the cloud, with resources that enable you to deliver everything from simple cloud-based apps to sophisticated, cloud-enabled enterprise applications. You purchase the resources you need from a cloud service provider on a pay- as-you-go basis and access them over a secure Internet connection.

Like IaaS, PaaS includes infrastructure—servers, storage, and networking—but also middleware, development tools, business intelligence (BI) services, database management systems, and more.

upvoted 14 times

 **Bobip** Most Recent 20 hours ago

PaaS:

-The fact that it's hosted in the cloud means you are leveraging cloud infrastructure, but you are not managing the underlying infrastructure components like virtual machines or storage. Instead, you are using a managed service.

-The management of software updates by Azure indicates that the database service is fully managed by the cloud provider, which aligns with the characteristics of a PaaS offering.

upvoted 1 times

Question #87

Topic 1

Which cloud computing model includes on-premises and cloud-based resources?

- A. hybrid
- B. public
- C. private

Correct Answer: A

A hybrid cloud “sometimes called a cloud hybrid” is a computing environment that combines an on-premises datacenter (also called a private cloud) with a public cloud, allowing data and applications to be shared between them. Some people define hybrid cloud to include multicloud configurations where an organization uses more than one public cloud in addition to their on-premises datacenter.

this question was in my exam - 18/05/2023

upvoted 2 times

  **Stasheck** 12 months ago

Selected Answer: A

In general, on-prem is not the same as private cloud - as per MS, you can actually have private cloud deployed from some other vendor datacenter (not necessarily "on-prem" per se). However, in many questions regarding hybrid model "on-prem"+"public cloud" = hybrid, on-prem is not "cloud" per se, but it's private, and private + public cloud => hybrid.

upvoted 3 times

  **minigold** 1 year ago

I am always confused ...

- 1. Question said “Which cloud computing model ...”, it means that answer [A. hybrid] is [hybrid cloud computing model].
 - 2. Question said “... includes on-premises & cloud-based resources”, then it means [on-premises] is not cloud service.
- Therefore, “hybrid cloud = [On-premises (not cloud)] + [cloud-based resources (cloud)] ” is right? I don't think so, on-premise is not cloud. I think [on-premise] & [private cloud] are different, but this question deals both as same thing. Which point am I making a misunderstanding?
- upvoted 1 times

  **JT19760106** 1 year ago

Short answer, yes you are misunderstanding.

upvoted 4 times

Question #88

Topic 1

HOTSPOT -

Select the answer that correctly completes the sentence.

Hot Area:

Answer Area

Autoscaling is an example of

agility.

elasticity.

geo-distribution.

predictability.

Correct Answer:

Answer Area

Autoscaling is an example of

agility.

elasticity.

geo-distribution.

predictability.

An Azure virtual machine scale set can automatically increase or decrease the number of VM instances that run your application. This automated and elastic behavior reduces the management overhead to monitor and optimize the performance of your application.

Also: Azure elasticity as a service is referred to a cloud service that enables in automatically scaling Azure hosted resources in par with the demand and configured parameters. It provides Azure Administrators with the ability to auto scale Azure infrastructure and resources as and when needed.

Reference:

<https://docs.microsoft.com/en-us/azure/virtual-machine-scale-sets/virtual-machine-scale-sets-autoscale-overview><https://www.netreo.com/cloud-automation/what-is-azure-elasticity-as-a-service/>

wazmac

Highly Voted

12 months ago

Correct:

Autoscaling takes advantage of the elasticity of cloud-hosted environments while easing management overhead. It reduces the need for an operator to continually monitor the performance of a system and make decisions about adding or removing resources.

<https://learn.microsoft.com/en-us/azure/architecture/best-practices/auto-scaling>

upvoted 12 times

duo2

10 months, 1 week ago

The link you shared does mentioned it being elastic, but auto-scale is a form of predictability. So, which is correct. It's def do both, but if I have to pick one is predictability.

<https://learn.microsoft.com/en-us/azure/azure-monitor/autoscale/autoscale-predictive?toc=https%3A%2F%2Flearn.microsoft.com%2Fen-us%2Fazure%2Fvirtual-machine-scale-sets%2Ftoc.json&bc=https%3A%2F%2Flearn.microsoft.com%2Fen-us%2Fazure%2Fbread%2Ftoc.json>

Question #90

Topic 1

Which term represents the ability to increase the computing capacity of a virtual machine by adding memory or CPUs?

- A. agility
- B. vertical scaling
- C. horizontal scaling
- D. elasticity

Correct Answer: B

Vertical scaling, also known as scale up and scale down, means increasing or decreasing virtual machine (VM) sizes in response to a workload. Compare this behavior with horizontal scaling, also referred to as scale out and scale in, where the number of VMs is altered depending on the workload.

Reference:

<https://docs.microsoft.com/en-us/azure/virtual-machine-scale-sets/virtual-machine-scale-sets-vertical-scale-reprovision>

Vertical is correct, thanks for the explanation!

upvoted 21 times
- rrfatesingh**

Highly Voted

1 year ago

Horizontal scaling (Scaling in and Scaling out) is flexible in a cloud situation as it allows you to run a large number of VMs to handle load. Vertical scaling (Scaling up and Scaling down) keeps the number of resources constant, but gives those resources more capacity in terms of memory, CPU speed, disk space and network.

Guys, Read the question The question is asking you 'WHICH TERM' that indicates a single word. In reality A & B would both be correct, However this question is one of those nasty red herrings designed to throw you off & i feel have no place in an exam like this. it should be all about getting one over the line, not deliberately trying to cause people to fail just to increase revenue from retakes etc. Trust me , the answer here is A (AGILITY)

What is an example of term?

A term is a word or expression used with a particular meaning. "Rap," "punk," "grunge," and "heavy metal" are terms that describe particular styles of music. "Sweetie" is a term of endearment, at least to most people.

<https://www.vocabulary.com/dictionary/term#:~:text=A%20term%20is%20a%20word,at%20least%20to%20most%20people.>

Question #91

Topic 1

What are two benefits of cloud computing? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

- A. enables the rapid provisioning of resources
- B. has increased administrative complexity
- C. has the same configuration options as on-premises
- D. shifts capital expenditures (CAPEX) to operating expenditures (OPEX)

Correct Answer: AD

Azure allows you to build, deploy, and manage apps more quickly and easily without having to buy and/or maintain the underlying infrastructure. Azure provides flexibility between CapEx and OpEx

Capital expenditures generate benefits over a long period. These expenditures are generally nonrecurring and result in the acquisition of permanent assets.

Building an application could qualify as a capital expenditure. Example, Azure Reserved Instances (Azure RI) help Azure's most active customers save on long- term VM usage reserving VMs in advance at a discounted price by committing to a one or three-year benefits.

Operating expenditures are ongoing costs of doing business. Consuming cloud services in a pay-as-you-go model could qualify as an operating expenditure.

Example, you pay for a service or product as you use it i.e. pay-as-you-go pricing.

Question #92

Topic 1

What is a feature of an Azure virtual network?

- A. resource cost analysis
- B. packet inspection
- C. geo-redundancy
- D. isolation and segmentation

Correct Answer: D

Implement network segmentation patterns on Azure.

A unified enterprise segmentation strategy guides technical teams to consistently segment access using networking, applications, identity, and any other access controls. Create segmentation in your network footprint by defining perimeters.

The main reasons for segmentation are:

The ability to group related assets that are a part of (or support) workload operations.

Isolation of resources.

Governance policies set by the organization.

Azure Virtual Network (VNet) is the fundamental building block for your private network in Azure. VNet enables many types of Azure resources, such as Azure Virtual Machines (VM), to securely communicate with each other, the internet, and on-premises networks. VNet is similar to a traditional network that you'd operate in your own data center, but brings with it additional benefits of Azure's infrastructure such as scale, availability, and isolation.

upvoted 3 times

Question #96

Topic 1

You need to identify the type of failure for which an Azure Availability Zone can be used to protect access to Azure services. What should you identify?

- A. a physical server failure
- B. an Azure region failure
- C. a storage failure
- D. an Azure data center failure

Correct Answer: D

Availability zones expand the level of control you have to maintain the availability of the applications and data on your VMs. An Availability Zone is a physically separate zone, within an Azure region. There are three Availability Zones per supported Azure region. Each Availability Zone has a distinct power source, network, and cooling. By architecting your solutions to use replicated VMs in zones, you can protect your apps and data from the loss of a datacenter. If one zone is compromised, then replicated apps and data are instantly available in another zone.

It seems that in these questions designed by Microsoft it always follows this thinking pattern:

Regions > Zones > Data Centre.

When you see a question like this with the keyword Zone AUTOMATICALLY you think protecting or managing data centers!

Question #97

Topic 1

HOTSPOT -

You plan to extend your company's network to Azure.

The network contains a VPN appliance that uses an IP address of 131.107.200.1.

You need to create an Azure resource that defines the VPN appliance in Azure.

Which Azure resource should you create? To answer, select the appropriate resource in the answer area.

Hot Area:

Answer Area

Services

	NAT gateways	★
	Application gateways	★
	Local network gateways	★
	Virtual network gateways	★
	On-premises Data Gateways	★
	Azure Data Box Gateway	★
	Azure Stack Edge / Data Box Gateway	★
	Web Application Firewall policies	★

Correct Answer:

Answer Area

Services

	NAT gateways	★
	Application gateways	★
	Local network gateways	★
	Virtual network gateways	★
	On-premises Data Gateways	★
	Azure Data Box Gateway	★
	Azure Stack Edge / Data Box Gateway	★
	Web Application Firewall policies	★

A Local Network Gateway is an object in Azure that represents your on-premise VPN device. A Virtual Network Gateway is the VPN object at the Azure end of the VPN. A 'connection' is what connects the Local Network Gateway and the Virtual Network Gateway to bring up the VPN.

The local network gateway typically refers to your on-premises location. You give the site a name by which Azure can refer to it, then specify the IP address of the on-premises VPN device to which you will create a connection. You also specify the IP address prefixes that will be routed through the VPN gateway to the VPN device. The address prefixes you specify are the prefixes located on your on-premises network. If your on-premises network changes or you need to change the public IP address for the VPN device, you can easily update the values later.

Reference:

<https://docs.microsoft.com/en-us/azure/vpn-gateway/vpn-gateway-howto-site-to-site-resource-manager-portal>

 **BL101** Highly Voted 1 year, 11 months ago

I didn't get this at first - but then re-read the question - the clue is in the extension to Azure which indicates you are on Prem - so you need a Local Network Gateway - that's why people who said Virtual Network Gateway are wrong

upvoted 69 times

- VinnyMacD** 1 month, 1 week ago

Local - means creating a resource in your DC.
Ask is - You need to create an "Azure resource" that defines the VPN "appliance in Azure."
Answer is - Virtual Network Gateway.
upvoted 2 times
- Foow** 1 year, 8 months ago

Is the word "appliance" also not a flag for recognizing that it is on-premise?
upvoted 7 times
- RougePotatoe** 8 months, 2 weeks ago

In support of this answer. Read what is local network gateway. The local network gateway is a specific object that represents your on-premises location (the site) for routing purposes. You give the site a name by which Azure can refer to it, then specify the IP address of the on-premises VPN device to which you'll create a connection. You also specify the IP address prefixes that will be routed through the VPN gateway to the VPN device. The address prefixes you specify are the prefixes located on your on-premises network. If your on-premises network changes or you need to change the public IP address for the VPN device, you can easily update the values later.

Question #98

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You plan to deploy several Azure virtual machines.

You need to ensure that the services running on the virtual machines are available if a single data center fails.

Solution: You deploy the virtual machines to two or more resource groups.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: B

A resource group is a logical container for Azure resources. When you create a resource group, you specify which location to create the resource group in.

However, when you create a virtual machine and place it in the resource group, the virtual machine can still be in a different location (different datacenter).

Therefore, creating multiple resource groups, even if they are in separate datacenters does not ensure that the services running on the virtual machines are available if a single data center fails.

Question #99

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You plan to deploy several Azure virtual machines.

You need to ensure that the services running on the virtual machines are available if a single data center fails.

Solution: You deploy the virtual machines to a scale set.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: B

This answer does not specify that the scale set will be configured across multiple data centers so this solution does not meet the goal. Azure virtual machine scale sets let you create and manage a group of load balanced VMs. The number of VM instances can automatically increase or decrease in response to demand or a defined schedule. Scale sets provide high availability to your applications, and allow you to centrally manage, configure, and update many VMs.

Virtual machines in a scale set can be deployed across multiple update domains and fault domains to maximize availability and resilience to outages due to data center outages, and planned or unplanned maintenance events.

🗨️ 👤 **mustaqueali** 2 years, 5 months ago

Answer A is Correct: <https://docs.microsoft.com/en-us/azure/virtual-machine-scale-sets/overview#differences-between-virtual-machines-and-scale-sets> In this link, it clearly states that "Automatic distribution of VM instances across Availability Zones or Availability Sets"

upvoted 4 times

🗨️ 👤 **mecsuresh** 2 years, 3 months ago

Availability Set & Scale Set are different , so Ans : B

<https://medium.com/awesome-azure/difference-between-scale-set-and-availability-set-in-azure-9b2da03b891c>

upvoted 2 times

🗨️ 👤 **Arqueiro** 2 years, 4 months ago

I upvoted this answer but giving a second though the question indeed does not mention if the scale set is configured across multiple DCs.

The scale set will automatically deploy the VMs on an availability zone OR availability set. Availability set does not help in case of a DC issue, and it is not clear if there is an availability zone configured/available or not.

upvoted 4 times

When a subscription expires, the trusted instance of the Azure AD service remains, but the security principals lose access to Azure resources. Subscriptions can only trust a single directory while one Azure AD may be trusted by multiple subscriptions.

<https://learn.microsoft.com/en-us/azure/active-directory/fundamentals/active-directory-how-subscriptions-associated-directory>
upvoted 2 times

  **Sunilyaswanth_123** 3 months, 2 weeks ago

No, an Azure subscription cannot be directly associated with multiple Azure Active Directory (AD) tenants. A subscription can only be associated with a single Azure AD tenant at a time. During the creation of an Azure subscription, you specify the Azure AD tenant that will be associated with it, and this association cannot be changed later.

  **serrapadre** 8 months ago

Yet another poorly worded question. A subscription is associated with the AAD itself. A single AAD can have multiple tenants. But the first question is NO because it is implying there are multiple AADs. A single AAD with multiple tenants, and the answer is YES. Similarly, the second question is YES because they are saying you can change the subscription to a different AAD. Putting the word "tenant" in the question is confusing and ambiguous. "An Azure subscription can be associated to multiple Azure ADs." "You can change the Azure AD to which an Azure subscription is associated." Tenants is irrelevant. Typical Microsoft.

When you associate a subscription with a different directory, users that have roles assigned using Azure role-based access control lose their access. Classic subscription administrators, including Service Administrator and Co-Administrators, also lose access.

Moving your Azure Kubernetes Service (AKS) cluster to a different subscription, or moving the cluster-owning subscription to a new tenant, causes the cluster to lose functionality due to lost role assignments and service principal's rights. For more information about AKS, see Azure Kubernetes Service (AKS).

Question #101

Topic 1

This question requires that you evaluate the underlined text to determine if it is correct.

Resource groups provide organizations with the ability to manage the compliance of Azure resources across multiple subscriptions.

Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed`. If the statement is incorrect, select the answer choice that makes the statement correct.

- A. No change is needed
- B. Management groups
- C. Azure policies
- D. Azure App Service plans

Correct Answer: C

Azure policies can be used to define requirements for resource properties during deployment and for already existing resources. Azure Policy controls properties such as the types or locations of resources.

Azure Policy is a service in Azure that you use to create, assign, and manage policies. These policies enforce different rules and effects over your resources, so those resources stay compliant with your corporate standards and service level agreements. Azure Policy meets this need by evaluating your resources for non- compliance with assigned policies. All data stored by Azure Policy is encrypted at rest.

For example, you can have a policy to allow only a certain SKU size of virtual machines in your environment. Once this policy is implemented, new and existing resources are evaluated for compliance. With the right type of policy, existing resources can be brought into compliance.

 3 years, 10 months ago

Shouldn't the answer be B?

Msftlearn: "Azure management groups are containers for managing compliances across multiple subscriptions."

upvoted 243 times
-   **Harry28731** 1 year, 9 months ago

Yes it is B. Again we need to understand MS Logic.

Key word is NOT compliance BUT ACCROSS MULTIPLE SUBSCRIPTIONS.

Having the ability to manage compliance accross multiple subscriptions is THE DEFINITION of management groups.

<https://docs.microsoft.com/en-us/azure/governance/policy/overview>

If your organization has many subscriptions, you may need a way to efficiently manage access, policies, and compliance for those subscriptions. Azure management groups provide a level of scope above subscriptions.

Yes we need Azure Policies to manage compliance of Azure Ressources this is why its confusing, but only Management Groups provides a simple way (or "the ability") to do it accross multiple subscriptions, else you would have to go one by one...

Si yes ANSWER is B per the DEFINITION of Management groups, even though it's not a sufficient condition.

upvoted 31 times
-   **Rogerjak** 1 year, 7 months ago

Okay, I'm convinced. A Policy is a standalone thing, you can apply it to a subscription, BUT you can't use a POLICY to manage something across multiple subscriptions, that's what the Management Group is for: to create a baseline for several subscriptions on the same tenant.

upvoted 8 times
-   **[Removed]** 1 year, 4 months ago

Well, you can assign a policy to a management group, so it can be used for the purpose requested here. See <https://docs.microsoft.com/en-us/learn/modules/intro-to-azure-policy/3-how-azure-policy-works>

upvoted 1 times
-   **Harry28731** 1 year, 9 months ago

And to add more weight, if you DIDN'T have managment groups, you won't be able to manage compliance ACROSS subcriptions but only PER subcription. (Assignements are inherited by child ressources).

I understand that without Azure Policies we do nothing, but again we need to understand MS Logic that is to show us what is the real purpose of MG Groups which is a scope ABOVE subscription.

upvoted 6 times
-   **vaibhavganeja** 2 years, 3 months ago

100% it is Management Groups. Please refer the very first line on this link <https://docs.microsoft.com/en-us/azure/governance/management-groups/overview>

Underlined text "Resource groups"
Key is "to manage the compliance of Azure Resources"
A. "No change is needed" > Not correct because the sentence has no sense.
B. "Management groups" > Manage subscriptions. > Not correct in the context, the sentence is about manage resources.
C. "Azure policies" > CORRECT, the only one valid.
D. "Azure App Service plans" > it has no sense.
Resource group: Resources combination, logical container deployed and managed (web apps, dddbb, and storage accounts).
Management Groups: Help to manage access, policy, and compliance for multiple subscriptions.
Azure policy: Service in Azure that enables you to create, assign, and manage policies that control or audit your resources in the way to get compliance with your business rules.

Azure policies manages only at or below subscription level, not across multiple subscriptions
upvoted 11 times

  **MGJG** 2 years ago
If you plan to apply this policy definition to multiple subscriptions, the location must be a management group that contains the subscriptions you assign the policy to. The same is true for an initiative definition.

upvoted 6 times

  **PeterV72**  1 week, 4 days ago
Management Groups facilitate the hierarchical ordering of Azure resources into collections, at a level of scope above subscriptions. Distinct governance conditions can be applied to each management group, with Azure Policy and Azure RBACs, to manage Azure subscriptions effectively. The resources and subscriptions assigned to a management group automatically inherit the conditions applied to the management group.

In short, the answer to your question is 'Management Groups'
Answer supplied by a Microsoft Azure Engineer
upvoted 1 times

  **Capzn** 3 weeks, 4 days ago
Resource groups provide organizations with the ability to manage the compliance of Azure resources across multiple subscriptions. - This is from microsoft documentation. So both options B and C are incorrect. the correct option here is A.

C. Azure Policies
resource from ChatGPT:
The Azure feature that provides organizations with the ability to manage the compliance of Azure resources across multiple subscriptions is called Azure Policy.

Azure Policy is a service in Azure that allows you to create, assign, and enforce policies to ensure compliance and governance across your Azure resources. With Azure Policy, you can define a set of rules and conditions that your resources must adhere to, and Azure will continuously evaluate and enforce those policies.

Question #102

Topic 1

Your company plans to migrate to Azure.

The company has several departments. All the Azure resources used by each department will be managed by a department administrator.

What are two possible techniques to segment Azure for the departments? Each correct answer presents a complete solution.

NOTE: Each correct selection is worth one point.

- A. multiple subscriptions
- B. multiple Azure Active Directory (Azure AD) directories
- C. multiple regions
- D. multiple resource groups

Correct Answer: AD

An Azure subscription is a container for Azure resources. It is also a boundary for permissions to resources and for billing. You are charged monthly for all resources in a subscription. A single Azure tenant (Azure Active Directory) can contain multiple Azure subscriptions. A resource group is a container that holds related resources for an Azure solution. The resource group can include all the resources for the solution, or only those resources that you want to manage as a group.

To enable each department administrator to manage the Azure resources used by that department, you will need to create a separate subscription per department. You can then assign each department administrator as an administrator for the subscription to enable them to manage all resources in that subscription.

Question #103

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
A single Microsoft account can be used to manage multiple Azure subscriptions.	☐	☐
Two Azure subscriptions can be merged into a single subscription.	☐	☐
A company can use resources from multiple subscriptions.	☐	☐

Answer Area

	Statements	Yes	No
Correct Answer:	A single Microsoft account can be used to manage multiple Azure subscriptions.	☒	☐
	Two Azure subscriptions can be merged into a single subscription.	☐	☒
	A company can use resources from multiple subscriptions.	☒	☐

Box 1: Yes -

You can use the same account to manage multiple subscriptions. You can create an additional subscription for your account in the Azure portal. You may want an additional subscription to avoid hitting subscription limits, to create separate environments for security, or to isolate data for compliance reasons.

Box 2: No -

You cannot merge two subscriptions into a single subscription. However, you can move some Azure resources from one subscription to another. You can also transfer ownership of a subscription and change the billing type for a subscription.

Box 3: Yes -

A company can have multiple subscriptions and store resources in the different subscriptions. However, a resource instance can exist in only one subscription.

Question #104

Topic 1

HOTSPOT -

To complete the sentence, select the appropriate option in the answer area.

Hot Area:

Answer Area

You have several virtual machines in an Azure subscription.
You create a new subscription.

- | |
|--|
| The virtual machines cannot be moved to the new subscription. |
| The virtual machines can be moved to the new subscription. |
| The virtual machines can be moved to the new subscription only if they are all in the same resource group. |
| The virtual machines can be moved to the new subscription only if they run Windows Server 2016. |

Answer Area

You have several virtual machines in an Azure subscription.
You create a new subscription.

Correct Answer:

- | |
|--|
| The virtual machines cannot be moved to the new subscription. |
| The virtual machines can be moved to the new subscription. |
| The virtual machines can be moved to the new subscription only if they are all in the same resource group. |
| The virtual machines can be moved to the new subscription only if they run Windows Server 2016. |

You can move a VM and its associated resources to a different subscription by using the Azure portal.

Moving between subscriptions can be handy if you originally created a VM in a personal subscription and now want to move it to your company's subscription to continue your work. You do not need to start the VM in order to move it and it should continue to run during the move.

For a move across subscriptions, the resource and its dependent resources must be located in the same resource group and they must be moved together. For example, a VM with managed disks would require the VM and the managed disks to be moved together, along with other dependent resources.

If you're moving a resource to a new subscription, check to see whether the resource has any dependent resources, and whether they're located in the same resource group. If the resources aren't in the same resource group, check to see whether the resources can be combined into the same resource group. If so, bring all these resources into the same resource group by using a move operation across resource groups. So, answer is the third option

<https://docs.microsoft.com/en-us/azure/azure-resource-manager/management/move-resource-group-and-subscription>

upvoted 6 times

🗒️ 👤 **Duke_Lew** 1 year, 9 months ago

Use the Azure portal to move a VM to a different subscription

You can move a VM and its associated resources to a different subscription by using the Azure portal.

Go to the Azure portal to manage the resource group containing the VM to move. Search for and select Resource groups.

Choose the resource group containing the VM that you would like to move.

At the top of the page for the resource group, select Move and then select Move to another subscription. The Move resources page opens.

Select each of the resources to move. In most cases, you should move all of the related resources that are listed.

Select the Subscription where you want the VM to be moved.

Select an existing Resource group, or enter a name to have a new resource group created.

When you are done, select that you understand that new resource IDs will be created and that the new IDs will need to be used with the VM after it is moved, and then select OK.

I think I will choose B as my answer..as it just listed "In most cases".

upvoted 3 times

Question #105

Topic 1

You have an Azure environment that contains multiple Azure virtual machines.

You plan to implement a solution that enables the client computers on your on-premises network to communicate to the Azure virtual machines.

You need to recommend which Azure resources must be created for the planned solution.

Which two Azure resources should you include in the recommendation? Each correct answer presents part of the solution.

NOTE: Each correct selection is worth one point.

- A. a virtual network gateway
- B. a load balancer
- C. an application gateway
- D. a virtual network
- E. a gateway subnet

Correct Answer: AE

To implement a solution that enables the client computers on your on-premises network to communicate to the Azure virtual machines, you need to configure a VPN (Virtual Private Network) to connect the on-premises network to the Azure virtual network.

The Azure VPN device is known as a Virtual Network Gateway. The virtual network gateway needs to be located in a dedicated subnet in the Azure virtual network. This dedicated subnet is known as a gateway subnet and must be named 'GatewaySubnet'.

Note: a virtual network (answer D) is also required. However, as we already have virtual machines deployed in a Azure, we can assume that the virtual network is already in place.

References:

<https://docs.microsoft.com/en-us/office365/enterprise/connect-an-on-premises-network-to-a-microsoft-azure-virtual-network>

- NoNotSpam

Highly Voted

3 years, 10 months ago

If you already have Azure VMs, this implies you have a VNet already. Thus the answer should be Gateway Subnet and VNet Gateway
upvoted 246 times
- richardsonbq

3 years, 10 months ago

I agree with your logic. I was also wondering wether Gateway Subnet is really a resource (for me, is just a configuration). So maybe the best answer would be Virtual Netowrk Gateway and Virtual Newtwork (if not already exists)
upvoted 29 times
- ananthbhaskar

3 years, 3 months ago

It has been mentioned that they are planning to connect On prem with Azure, so we need to consider there is no VM exist. keyword word is Planning. Answer would be Virtual Network & virtual network gateway.
upvoted 21 times
- N3rdy

3 years, 2 months ago

Wrong. The plan is about client computers that are on-prem connecting to Azure VMs. You already have an Azure environment with existing VMs, to which you want to connect to. Meaning Virtual network already exists. So you need a gateway subnet and a VNET gateway.
upvoted 27 times
- examtopics6969

2 years, 3 months ago

No, no, no - there is statement: "You have an Azure environment that contains multiple Azure virtual machines." so VNet is there already
upvoted 18 times
- alexander_panfilenok

11 months ago

Why do u think that all VMs are in a vNet?
upvoted 4 times
- _syamantak

3 years, 2 months ago

No, the qs clearly says to plan for "on-premises network to communicate to the Azure virtual machines." if there is a VM in azure, a Vnet is already created. you gotta create the VPN gateway (A)
upvoted 4 times
- awssecuritynewbie

3 years, 1 month ago

Selected Answer: AD

Azure Virtual Network (VNet): Create a virtual network in Azure to provide the network connectivity and isolation for your Azure resources. The virtual network acts as a bridge between your on-premises network and the Azure environment. You can establish a site-to-site VPN connection or use Azure ExpressRoute to connect your on-premises network to the Azure VNet.

Azure Virtual Network Gateway: To establish the connection between your on-premises network and the Azure VNet, you need to create an Azure Virtual Network Gateway. The gateway provides the necessary VPN or ExpressRoute connectivity for secure and reliable communication between the on-premises network and the Azure environment.
upvoted 2 times

🗲️ 👤 **BabyYodalsCute** 4 months, 3 weeks ago

upvoted 1 times

🗨️ 👤 **Nknow3** 5 months, 3 weeks ago

To enable communication between your on-premises network and the Azure virtual machines, you need to create a virtual network that serves as a communication platform. This network should have a gateway subnet, which hosts the Virtual network gateway.

hope this helps

upvoted 2 times

🗨️ 👤 **daytac** 6 months ago

Got this question on 3.25.2023

upvoted 1 times

🗨️ 👤 **bangladeshrocks** 6 months, 2 weeks ago

Correct Answer: AC, ChatGPT:

To enable communication between on-premises client computers and Azure virtual machines, you need to create a VPN connection between the two environments. For this, you need to create a virtual network and a virtual network gateway. Therefore, options A and D are the correct answers.

Option B, a load balancer, is not required for this scenario because load balancing is used to distribute network traffic across multiple servers to ensure high availability and scalability.

Option C, an application gateway, is used to manage web traffic and to provide functions such as SSL termination, URL-based routing, and multi-site hosting. It is not required for this scenario because it is not related to connecting on-premises client computers to Azure virtual machines.

Option E, a gateway subnet, is a subnet used by the virtual network gateway. It is not a separate Azure resource that needs to be created, but rather a subnet that is created within the virtual network. Therefore, it is not a standalone option in this scenario.

🗨️ 👤 **mattygster** 6 months, 3 weeks ago

This is a little tricky of a wording isnt it? a gateway submt? I would think a Virtual network would be the right answer as you could have just a bunch of backend instances and 1 or 2 machines qualifying to be remotely accessed. This would justify accessing them in a virtual network and pairing that with the on-prem network.

🗨️ 👤 **viktornm** 7 months, 2 weeks ago

To implement a solution that enables the client computers on your on-premises network to communicate to the Azure virtual machines, you need to configure a VPN (Virtual Private Network) to connect the on-premises network to the Azure virtual network.

The Azure VPN device is known as a Virtual Network Gateway. The virtual network gateway needs to be located in a dedicated subnet in the Azure virtual network. This dedicated subnet is known as a gateway subnet and must be named GatewaySubnet.

Note: a virtual network (answer D) is also required. However, as we already have virtual machines deployed in a Azure, we can assume that the virtual network is already in place.

upvoted 1 times

🗨️ 👤 **gauloises22** 8 months, 1 week ago

Seems like answer AE is correct - based on assumption that since the VMs already exist on Azure cloud, they are already configured within a VNet. Either ways, according to Microsoft's VPN Gateway FAQ page, you can't have the gateway without firstly configuring the subnet.

<https://learn.microsoft.com/en-us/azure/vpn-gateway/vpn-gateway-vpn-faq#do-i-need-a-gatewaysubnet>

"Do I need a 'GatewaySubnet'?

Yes. The gateway subnet contains the IP addresses that the virtual network gateway services use. You need to create a gateway subnet for your VNet in order to configure a virtual network gateway. All gateway subnets must be named 'GatewaySubnet' to work properly. Don't name your gateway subnet something else. And don't deploy VMs or anything else to the gateway subnet."

Question #106

Topic 1

You attempt to create several managed Microsoft SQL Server instances in an Azure environment and receive a message that you must increase your Azure subscription limits.
What should you do to increase the limits?

- A. Create a service health alert
- B. Upgrade your support plan
- C. Modify an Azure policy
- D. Create a new support request

Correct Answer: D

Many Azure resource have quote limits. The purpose of the quota limits is to help you control your Azure costs. However, it is common to require an increase to the default quota.

You can request a quota limit increase by opening a support request. In the support request, select 'Service and subscription limits (quotas)' for the Issue type, select your subscription and the service you want to increase the quota for. For this question, you would select 'SQL Database Managed Instance' as the quote type.

Reference:
<https://docs.microsoft.com/en-us/azure/sql-database/sql-database-managed-instance-resource-limits#obtaining-a-larger-quota-for-sql-managed-instance>

Question #107

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
Each Azure subscription can contain multiple account administrators.	☐	☐
Each Azure subscription can be managed by using a Microsoft account only.	☐	☐
An Azure resource group contains multiple Azure subscriptions.	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
Each Azure subscription can contain multiple account administrators.	☐	☒
Each Azure subscription can be managed by using a Microsoft account only.	☐	☒
An Azure resource group contains multiple Azure subscriptions.	☐	☒

Box 1: No -

You can assign service administrators and co-administrators in the Azure Portal but there can only be one account administrator.

Box 2: No -

You need an Azure Active Directory account to manage a subscription, not a Microsoft account.

An account is created in the Azure Active Directory when you create the subscription. Further accounts can be created in the Azure Active Directory to manage the subscription.

Box 3: No -

Resource groups are logical containers for Azure resources. However, resource groups do not contain subscriptions. Subscriptions contain resource groups.

Reference:

<https://docs.microsoft.com/en-us/office365/enterprise/subscriptions-licenses-accounts-and-tenants-for-microsoft-cloud-offerings>

cherrada Highly Voted 3 years, 10 months ago

You can only have one account administrator per subscription:

OpenAI reply about multiple account administrators.

Yes, each Azure subscription can have multiple account administrators. Azure provides role-based access control (RBAC) to manage and control access to Azure resources and services. With RBAC, you can assign different roles to users, groups, or applications, granting them specific permissions and levels of access within a subscription.

upvoted 1 times

  **JoeGuan** 6 months, 3 weeks ago
Yes, an Azure subscription can have multiple account administrators. Account administrators have full access to all resources in the subscription, including the ability to manage access and permissions for other users and to change billing and subscription details.

When you create an Azure subscription, you are automatically designated as the Account Administrator. However, you can assign this role to other users in your organization or add additional Account Administrators to your subscription.

Question #109

Topic 1

HOTSPOT -

You plan to create an Azure virtual machine.

You need to identify which storage service must be used to store the unmanaged data disks of the virtual machine.

What should you identify? To answer, select the appropriate service in the answer area.

Hot Area:

Answer Area

 Containers Scalable, cost-effective storage for unstructured data Learn more	 File shares Serverless SMB file shares Learn more
 Tables Tabular data storage Learn more	 Queues Effectively scale apps according to traffic Learn more

Answer Area

Correct Answer:

 Containers Scalable, cost-effective storage for unstructured data Learn more	 File shares Serverless SMB file shares Learn more
 Tables Tabular data storage Learn more	 Queues Effectively scale apps according to traffic Learn more

Azure containers are the backbone of the virtual disks platform for Azure IaaS. Both Azure OS and data disks are implemented as virtual disks where data is durably persisted in the Azure Storage platform and then delivered to the virtual machines for maximum performance. Azure Disks are persisted in Hyper-V VHD format and stored as a page blob in Azure Storage.

Reference:

<https://docs.microsoft.com/en-us/azure/storage/blobs/storage-blob-pageblob-overview>

 **sdas2021**  2 years, 5 months ago

Correct. This came in the test yesterday. Thank you examtopics. Scored 910
upvoted 87 times

 **Saravana12g**  2 years, 3 months ago

Unmanaged disks are VHD files that are stored as page blobs in Azure storage accounts. The page blobs created by tenants are referred to as VM disks and are stored in containers in the storage accounts.

Question #110

Topic 1

Your company plans to move several servers to Azure.

The company's compliance policy states that a server named FinServer must be on a separate network segment.

You are evaluating which Azure services can be used to meet the compliance policy requirements.

Which Azure solution should you recommend?

- A. a resource group for FinServer and another resource group for all the other servers
- B. a virtual network for FinServer and another virtual network for all the other servers
- C. a VPN for FinServer and a virtual network gateway for each other server
- D. one resource group for all the servers and a resource lock for FinServer

Correct Answer: B

Networks in Azure are known as virtual networks. A virtual network can have multiple IP address spaces and multiple subnets. Azure automatically routes traffic between different subnets within a virtual network.

The question states that FinServer must be on a separate network segment. The only way to separate FinServer from the other servers in networking terms is to place the server in a different virtual network to the other servers.

Question #111

Topic 1

You plan to map a network drive from several computers that run Windows 10 to Azure Storage.
You need to create a storage solution in Azure for the planned mapped drive.
What should you create?

- A. an Azure SQL database
- B. a virtual machine data disk
- C. a File service in a storage account
- D. a Blob service in a storage account

Correct Answer: C

Azure Files is Microsoft's easy-to-use cloud file system. Azure file shares can be seamlessly used in Windows and Windows Server. To use an Azure file share with Windows, you must either mount it, which means assigning it a drive letter or mount point path, or access it via its UNC path.

Unlike other SMB shares you may have interacted with, such as those hosted on a Windows Server, Linux Samba server, or NAS device, Azure file shares do not currently support Kerberos authentication with your Active Directory (AD) or Azure Active Directory (AAD) identity, although this is a feature we are working on.

Instead, you must access your Azure file share with the storage account key for the storage account containing your Azure file share. A storage account key is an administrator key for a storage account, including administrator permissions to all files and folders within the file share you're accessing, and for all file shares and other storage resources (blobs, queues, tables, etc) contained within your storage account.

Azure Files shares can be mounted concurrently by cloud or on-premises deployments of Windows, Linux, and macOS. Azure Files shares can also be cached on Windows Servers with Azure File Sync for fast access near where the data is being used.

Selected Answer: C

To create a storage solution in Azure for mapping a network drive from computers running Windows 10, you will need to create an Azure file share.

An Azure file share is a managed file storage service that enables you to create a shared network drive in Azure and access it from any device that supports the SMB (Server Message Block) protocol, including computers running Windows 10.

upvoted 3 times

  **Pinha** 8 months, 3 weeks ago

C. a File service in a storage account

To create a storage solution in Azure for the planned mapping drive, you should create a File service in a storage account.

Azure Storage is a cloud storage service that provides a range of storage options for unstructured data, including files, blobs, tables, and queues. The File service in Azure Storage enables you to create file shares that can be accessed by Windows and Linux VMs, and also by on-premises computers over the internet using the Server Message Block (SMB) protocol.

After the storage account is created, you can create file shares within the File service and map a network drive to them from the computers that run Windows 10.

Elastic Job agents ★ PREVIEW	SQL managed instances ★

Azure Cosmos DB is Microsoft's globally distributed, multi-model database service. With a click of a button, Cosmos DB enables you to elastically and independently scale throughput and storage across any number of Azure regions worldwide.

Azure Cosmos DB is a great way to store unstructured and JSON data. Combined with Azure Functions, Cosmos DB makes storing data quick and easy with much less code than required for storing data in a relational database.

Keyword here "multiple region"

upvoted 1 times

  **Pinha** 8 months, 3 weeks ago

You should deploy Azure Cosmos DB to meet the requirements of adding data concurrently from multiple regions and storing JSON documents.

One of the key features of Azure Cosmos DB is its ability to scale horizontally across multiple regions, enabling you to add data concurrently from multiple regions and to serve low-latency, globally distributed workloads. It also supports native JSON storage and querying, allowing you to store and retrieve JSON documents in the database.

Question #113

Topic 1

Your company plans to start using Azure and will migrate all its network resources to Azure.

You need to start the planning process by exploring Azure.

What should you create first?

- A. a subscription
- B. a resource group
- C. a virtual network
- D. a management group

Correct Answer: A

The first thing you create in Azure is a subscription. You can think of an Azure subscription as an 'Azure account'. You get billed per subscription.

A subscription is an agreement with Microsoft to use one or more Microsoft cloud platforms or services, for which charges accrue based on either a per-user license fee or on cloud-based resource consumption.

- Microsoft's Software as a Service (SaaS)-based cloud offerings (Office 365, Intune/EMS, and Dynamics 365) charge per-user license fees.
- Microsoft's Platform as a Service (PaaS) and Infrastructure as a Service (IaaS) cloud offerings (Azure) charge based on cloud resource consumption.

You can also use a trial subscription, but the subscription expires after a specific amount of time or consumption charges. You can convert a trial subscription to a paid subscription.

Organizations can have multiple subscriptions for Microsoft's cloud offerings.

Question #114

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
All the Azure resources deployed to a resource group must use the same Azure region.	☐	☐
If you assign a tag to a resource group, all the Azure resources in that resource group are assigned to the same tag.	☐	☐
If you assign permissions for a user to manage a resource group, the user can manage all the Azure resources in that resource group.	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
All the Azure resources deployed to a resource group must use the same Azure region.	☐	☒
If you assign a tag to a resource group, all the Azure resources in that resource group are assigned to the same tag.	☐	☒
If you assign permissions for a user to manage a resource group, the user can manage all the Azure resources in that resource group.	☒	☐

Box 1: No -

Azure resources deployed to a single resource group can be located in different regions. The resource group only contains metadata about the resources it contains.

When creating a resource group, you need to provide a location for that resource group. You may be wondering, "Why does a resource group need a location?

And, if the resources can have different locations than the resource group, why does the resource group location matter at all?" The resource group stores metadata about the resources. When you specify a location for the resource group, you're specifying where that metadata is stored. For compliance reasons, you may need to ensure that your data is stored in a particular region.

Box 2: No -

Tags for Resources are not inherited by default from their Resource Group

Box 3: Yes -

A resource group can be used to scope access control for administrative actions. By default, permissions set at the resource level are inherited by the resources in the resource group.

HOTSPOT -

To complete the sentence, select the appropriate option in the answer area.

Hot Area:

Answer Area

Data that is stored in the Archive access tier of an Azure Storage account

- can be accessed at any time by using azcopy.exe.
- can only be read by using Azure Backup.
- must be restored before the data can be accessed.
- must be rehydrated before the data can be accessed.

Answer Area

Data that is stored in the Archive access tier of an Azure Storage account

Correct Answer:

- can be accessed at any time by using azcopy.exe.
- can only be read by using Azure Backup.
- must be restored before the data can be accessed.
- must be rehydrated before the data can be accessed.

Azure storage offers different access tiers: hot, cool and archive.

The archive access tier has the lowest storage cost. But it has higher data retrieval costs compared to the hot and cool tiers. Data in the archive tier can take several hours to retrieve.

While a blob is in archive storage, the blob data is offline and can't be read, overwritten, or modified. To read or download a blob in archive, you must first rehydrate it to an online tier.

Example usage scenarios for the archive access tier include:

- Long-term backup, secondary backup, and archival datasets
- Original (raw) data that must be preserved, even after it has been processed into final usable form.
- Compliance and archival data that needs to be stored for a long time and is hardly ever accessed.

Reference:

<https://docs.microsoft.com/en-us/azure/storage/blobs/storage-blob-storage-tiers?tabs=azure-portal#archive-access-tier>

- Edyu Highly Voted 2 years, 6 months ago

"rehydrated" is a funny term. I imagine that archived data are like "mummified" data - hidden for a very long time, dehydrated, and in order to recognize it, you "rehydrate" it.

upvoted 90 times
- kris09on 2 years, 5 months ago

The way I guessed about it is that we talk about Data Lake for large data usage, so it should be something related to water so that it becomes accessible- hence 'rehydrated'..

upvoted 35 times

Data that is stored in the Archive access tier of an Azure Storage account must be rehydrated before it can be accessed 1. You cannot access data that is stored on the archive tier without rehydrating it first 2. The correct answer is D. must be rehydrated before the data can be accessed
upvoted 2 times

  **helpme1** 7 months, 1 week ago
was on exam 2/11/2023
upvoted 4 times

  **Pinha** 8 months, 3 weeks ago
D. must be rehydrated before the data can be accessed.

The Archive access tier of an Azure Storage Account is designed for storing data that is infrequently accessed and for which retrieval times of several hours are acceptable. Data in the Archive access tier is stored in a secure, durable, and highly available manner, but it is not immediately accessible. In order to access data in the Archive access tier, it must first be "rehydrated," which is a process that retrieves the data from storage and makes it available for access. Rehydration typically takes several hours to complete, and once the data is rehydrated, it can be accessed just like any other data in the storage account.

Question #116

Topic 1

HOTSPOT -

You plan to deploy a critical line-of-business application to Azure.

The application will run on an Azure virtual machine.

You need to recommend a deployment solution for the application. The solution must provide a guaranteed availability of 99.99 percent.

What is the minimum number of virtual machines and the minimum number of availability zones you should recommend for the deployment? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Minimum number of virtual machines:

1	✓
2	
3	

Minimum number of availability zones:

1	✓
2	
3	

Correct Answer:

Answer Area

Minimum number of virtual machines:

1	✓
2	
3	

Minimum number of availability zones:

1	✓
2	
3	

You need a minimum of two virtual machines with each one located in a different availability zone.

Availability Zones is a high-availability offering that protects your applications and data from datacenter failures. Availability Zones are unique physical locations within an Azure region. Each zone is made up of one or more datacenters equipped with independent power, cooling, and networking. To ensure resiliency, there's a minimum of three separate zones in all enabled regions. The physical separation of Availability Zones within a region protects applications and data from datacenter failures. Zone-redundant services replicate your applications and data across Availability Zones to protect from single-points-of-failure. With Availability Zones, Azure offers industry best 99.99% VM uptime SLA.

Question #117

Topic 1

Which Azure service should you use to collect events from multiple resources into a centralized repository?

- A. Azure Event Hubs
- B. Azure Analysis Services
- C. Azure Monitor
- D. Azure Stream Analytics

Correct Answer: A

Azure Event Hubs is a big data streaming platform and event ingestion service. It can receive and process millions of events per second. Data sent to an event hub can be transformed and stored by using any real-time analytics provider or batching/storage adapters.

Azure Event Hubs can be used to ingest, buffer, store, and process your stream in real time to get actionable insights. Event Hubs uses a partitioned consumer model, enabling multiple applications to process the stream concurrently and letting you control the speed of processing.

Azure Event Hubs can be used to capture your data in near-real time in an Azure Blob storage or Azure Data Lake Storage for long-term retention or micro-batch processing.

C. Azure Monitor

-- resources are azure resource

-- <https://medium.com/@kyleake/exam-az-900-microsoft-azure-fundamentals-most-complete-preparation-guide-ever-76614d31a59c>

To correlate events from multiple resources into a centralized repository. Log data collected by Azure Monitor is stored in a Log Analytics workspace, which is based on Azure Data Explorer. It collects telemetry from a variety of sources and uses the Kusto query language used by Data Explorer to retrieve and analyze data.

upvoted 58 times
-   **Harry28731** 1 year, 9 months ago

Azure Monitor collect Metrics and logs :

<https://docs.microsoft.com/en-us/azure/azure-monitor/overview>

Azure Events Hub collects Hubs :

<https://docs.microsoft.com/en-us/azure/event-hubs/event-hubs-about>

Azure Event Hubs is a big data streaming platform and EVENT ingestion service. It can RECEIVE and process MILLIONS of EVENTS per second. Data sent to an event hub can be transformed and stored by using any real-time analytics provider or batching/storage adapters.

It's basically the definition of Azure Event Hubs.

Additional reasoning is that Azure Monitor collect ONLY application or infrastructure related logs (that can be events) wheareas Event Hubs can collect Business events. The question mentions only EVENTS in general.

upvoted 25 times
-   **Harry28731** 1 year, 9 months ago

So NO. Answer is first Azure Events Hubs, and if not presents then we can suppose that Logs include Events so Azure Monitor but not the other order.

upvoted 13 times
-   **Capzn** Most Recent 3 weeks, 4 days ago

Azure Monitor can be used to collect multiple events from multiple Azure resources, storing them in a centralised repository. - This is from Microsoft documentation.

  **dd9396** 4 months, 3 weeks ago

To collect events from multiple resources into a centralized repository in Azure, you can use Azure Monitor. Azure Monitor is a centralized monitoring and logging solution that provides visibility into the performance and health of your Azure resources and applications. It supports collecting and analyzing data from a variety of sources, including Azure resources, Azure VMs, and custom applications.

Selected Answer: C

right response is azure monitor, because collecte multiple resource, reverse azure event hub

upvoted 1 times

  **Qeis** 6 months ago

C. Azure Monitor.

Azure Monitor is the Azure service designed to collect and analyze telemetry data from various Azure resources, including virtual machines, containers, and applications. It provides a centralized repository for collecting logs and metrics from different sources and supports various types of data sources and workloads.

Azure Event Hubs is a scalable data streaming platform that can ingest and process millions of events per second, but it is designed for real-time streaming and processing of event data, rather than storing it in a centralized repository.

Question #118

Topic 1

HOTSPOT -

To complete the sentence, select the appropriate option in the answer area.

Hot Area:

Answer Area

An Availability Zone in Azure has physically separate locations

	▼
across two continents.	
within a single Azure region.	
within multiple Azure regions.	
within a single Azure datacenter.	

Answer Area

An Availability Zone in Azure has physically separate locations

Correct Answer:

	▼
across two continents.	
within a single Azure region.	
within multiple Azure regions.	
within a single Azure datacenter.	

Availability Zones is a high-availability offering that protects your applications and data from datacenter failures. Availability Zones are unique physical locations within an Azure region.

Question #119

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area			
	Statements	Yes	No
	Data that is stored in an Azure Storage account automatically has at least three copies.	☐	☐
	All data that is copied to an Azure Storage account is backed up automatically to another Azure data center.	☐	☐
	An Azure Storage account can contain up to 2 TB of data and up to one million files.	☐	☐

Correct Answer:

Answer Area			
	Statements	Yes	No
	Data that is stored in an Azure Storage account automatically has at least three copies.	☒	☐
	All data that is copied to an Azure Storage account is backed up automatically to another Azure data center.	☐	☒
	An Azure Storage account can contain up to 2 TB of data and up to one million files.	☐	☒

Box 1: Yes -

There are different replication options available with a storage account. The 'minimum' replication option is Locally Redundant Storage (LRS). With LRS, data is replicated synchronously three times within the primary region.

Box 2: No -

Data is not backed up automatically to another Azure Data Center although it can be depending on the replication option configured for the account. Locally Redundant Storage (LRS) is the default which maintains three copies of the data in the data center. Geo-redundant storage (GRS) has cross-regional replication to protect against regional outages. Data is replicated synchronously three times in the primary region, then replicated asynchronously to the secondary region.

Box 3: No -

The limits are much higher than that. The current storage limit is 2 PB for US and Europe, and 500 TB for all other regions (including the UK) with no limit on the number of files.

I'm having a tuff time understanding if statement 1 is true why is statement 2 false?
By default, all data stored in an Azure Storage account is automatically replicated and backed up to another Azure data center within the same region to ensure high availability and durability of your data.

Thank you
upvoted 4 times

  **Nknow3** 5 months, 3 weeks ago
By default, locally-redundant storage (LRS) is selected, which replicates your data three times within the same data center. you have the option to choose geo-redundant storage (GRS) or read-access geo-redundant storage (RA-GRS), which replicates your data to another data center in a different region for additional protection against regional disasters or outages.

Question #120

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Statements	Yes	No
If you have Azure resources deployed to every region, you can implement availability zones in all the regions.	☐	☐
Only virtual machines that run Windows Server can be created in availability zones.	☐	☐
Availability zones are used to replicate data and applications to multiple regions.	☐	☐

Correct Answer:

Statements	Yes	No
If you have Azure resources deployed to every region, you can implement availability zones in all the regions.	☐	☒
Only virtual machines that run Windows Server can be created in availability zones.	☐	☒
Availability zones are used to replicate data and applications to multiple regions.	☐	☒

Box 1: No -
Not all Azure regions support availability zones.

Box 2: No -
Regions that support availability zones support Linux virtual machines.

Box 3: Yes -
Availability Zones is a high-availability offering that protects your applications and data from datacenter failures. Availability Zones are unique physical locations within an Azure region. Each zone is made up of one or more datacenters equipped with independent power, cooling, and networking. To ensure resiliency, there's a minimum of three separate zones in all enabled regions. The physical separation of Availability Zones within a region protects applications and data from datacenter failures. Zone-redundant services replicate your applications and data across Availability Zones to protect from single-points-of-failure. With Availability Zones, Azure offers industry best 99.99% VM uptime SLA.

All Enabled Regions have a minimum of 3 AZ zones. Therefore the answer is YES-NO-NO
upvoted 1 times

  **Harry28731** 1 year, 9 months ago
FIRST ANSWER IS NO ! Don't mislead people. Some regions do not support Availability Zones. <https://docs.microsoft.com/en-us/azure/availability-zones/glossary>

It exists RECOMMENDE regions AND ALTERNATE Regions. Alternate regions does not support AZ.

A region that extends Azure's footprint within a data-residency boundary where a recommended region also exists. Alternate regions help to optimize latency and provide a second region for disaster recovery needs. They aren't designed to support availability zones, although Azure conducts regular assessment of these regions to determine if they should become recommended regions. These regions are designated in the Azure portal as Other.
Ex: EUROPE UK WEST
upvoted 14 times

  **Pamban** 2 years, 5 months ago
agree with answer. but could you please further elaborate the explanation of 1st question? there is no way for us to make availability zones. doesn't matter how many AZs per region.
upvoted 2 times

  **stefano1856** 2 years, 4 months ago
It is a Microsoft's choice
some areas have it, others don't

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
North America is represented by a single Azure region.	☐	☐
Every Azure region has multiple datacenters.	☐	☐
Data transfers between Azure services located in different Azure regions are always free.	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
North America is represented by a single Azure region.	☐	☒
Every Azure region has multiple datacenters.	☒	☐
Data transfers between Azure services located in different Azure regions are always free.	☐	☒

Box 1: No -

North America has several Azure regions, including West US, Central US, South Central US, East Us, and Canada East.

Box 2: Yes -

A region is a set of datacenters deployed within a latency-defined perimeter and connected through a dedicated regional low-latency network.

Box 3: No -

Outbound data transfer is charged at the normal rate and inbound data transfer is free.

Q1 - No, Q2 - No, Q3 - No.
Q2 Explanatiion:
"Simply put, an Azure Region is a set of Datacenters that are connected through a dedicated low-latency network. How many datacenters does a region contain. Well, we do not have a fixed number. It varies. There are regions of different sizes. A Region could be made up of just 1 dataceneter or multiple datacenters. The point is, an Azure Region is a group of one or more Azure Datacenters." References:
<https://www.pragimtech.com/blog/azure/azure-regions-and-paired-regions/>
upvoted 157 times
-   Learner_123_ 4 months ago

Q2 - Yes
An Azure region contains 1 or more availability zones, and an availability zone contains 1 or more datacenters. Thus, there is definitely multiple datacenters in a single Azure region.

The most upvoted answer by hercu is wrong. please stop confusing people.

Here is a link to the diagram explanation of what I just said.
<https://learn.microsoft.com/en-us/azure/reliability/media/availability-zones-region-geography.png>

upvoted 7 times

  **zimzimzimma** 1 month, 2 weeks ago

"An Azure region contains 1 or more availability zones, and an availability zone contains 1 or more datacenters. " So what you're saying is that there's at least 1 datacenter in a region, since 1x1=1.

upvoted 1 times

  **jprentice** 1 month, 3 weeks ago

Not all regions have AZs. In your comment and even the graphic you linked used the term, "1 or more," meaning there is a possibility of a Region having only 1 AZ and 1 DC within (which would really just be considered to have no AZ and just 1 DC)

upvoted 6 times

  **mlop3s** 5 months, 3 weeks ago

You can see that no,no,no might be correct by checking this site and filtering by "availability zones not available"

<https://infrastructuremap.microsoft.com/explore>

Many regions do not offer AZs

upvoted 2 times

  **Harry28731** 1 year, 9 months ago

Q2 is unfortunately YES Per the definition :

<https://docs.microsoft.com/en-us/azure/availability-zones/az-overview>

Regions

Each Azure region features datacenters deployed within a latency-defined perimeter. They're connected through a dedicated regional low-latency network. This design ensures that Azure services within any region offer the best possible performance and security.

A set of datacenters deployed within a latency-defined perimeter and connected through a dedicated regional low-latency network.

In practice it may not be the case and some very small regions may have only one DC, but the definition excludes this practical case. So lets assume the mainstream answer.

upvoted 22 times

  **zimzimzimma** 1 month, 2 weeks ago

This is typical MS ambiguity. So it could be yes as well as no.

upvoted 1 times

  **Duke_Lew** 1 year, 9 months ago

I agree on the answers as No, No, No.

Guys, please check on the Question on #118 which shows that "One or more datacenters"

<https://www.examtopics.com/exams/microsoft/az-900/view/24/>

upvoted 9 times

Q2 Should be No: "A region is a geographical area on the planet containing at least one, but potentially multiple datacenters that are nearby and networked together with a low-latency network".

upvoted 32 times

  **vakkil** 2 years, 2 months ago

Do not confuse between Region and Availability zone.

Region A set of datacenters deployed within a latency-defined perimeter and connected through a dedicated regional low-latency network.

Availability Zone Unique physical locations within a region. Each zone is made up of one or more datacenters equipped with independent power, cooling, and networking.

upvoted 10 times

  **xian05** 2 years ago

Question 84: An Azure region contains ONE or more data centers that are connected...

upvoted 5 times

  **xian05** 2 years ago

Data centers*

upvoted 2 times

  **xian05** 2 years ago

But what about alternate (other) regions?

Definition: A region that extends Azure's footprint within a data residency boundary where a recommended region also exists. Alternate regions help to optimize latency and provide a second region for disaster recovery needs.

They are not designed to support Availability Zones (although Azure conducts regular assessment of these regions to determine if they should become recommended regions).

These are designated in the Azure portal as Other.

So no support for availability zones, so could only one.

Region is comprised of ONE or more Datacenter
upvoted 2 times

  **mmatchev** 7 months, 3 weeks ago

Q2: "YES" - An example of a Microsoft Azure region with only one datacenter is the Azure South Africa North region.
Yes, a Microsoft Azure region can contain only one datacenter. A datacenter is a physical location where Microsoft Azure infrastructure is housed and serves the customers in a specific geographic area. A region is a set of datacenters deployed within a latency-defined perimeter and connected through a high-speed, private network. Some regions may have multiple datacenters for increased reliability and to support higher levels of customer demand.
upvoted 2 times

Question #122

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You plan to deploy several Azure virtual machines.

You need to ensure that the services running on the virtual machines are available if a single data center fails.

Solution: You deploy the virtual machines to two or more scale sets.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: B

This answer does not specify that the scale set will be configured across multiple data centers so this solution does not meet the goal.

Azure virtual machine scale sets let you create and manage a group of load balanced VMs. The number of VM instances can automatically increase or decrease in response to demand or a defined schedule. Scale sets provide high availability to your applications, and allow you to centrally manage, configure, and update many VMs.

Virtual machines in a scale set can be deployed across multiple update domains and fault domains to maximize availability and resilience to outages due to data center outages, and planned or unplanned maintenance events.

No such thing called availability set - it is skate set. The answer is B.
upvoted 5 times
- foreverlearner

3 years, 5 months ago

It is a thing: "An availability set is a logical grouping of two or more VMs (on different racks inside the same Datacenter) that help keep your application available during planned or unplanned maintenance. ".
However, they wouldn't be helpful neither in this scenario, you would need to deploy the VMs in 2 different AZs
upvoted 23 times
- Himanshu27

3 years, 2 months ago

I Agree... VMs must be in two or more scale-sets but those scale-sets must be in different datacenters in same or different availability zones..(as per leow text on MSDN
>Scale sets are used to run multiple instances of your application. If one of these VM instances has a problem, customers continue to access your application through one of the other VM instances with minimal interruption.
>For additional availability, you can use Availability Zones to automatically distribute VM instances in a scale set within a single datacenter or across multiple datacenters.)
upvoted 4 times

Sorry again— there’s indeed such thing called Availability Sets. Too many things with Sets : -) apologies for confusion..
upvoted 15 times
- Smikky

2 years, 8 months ago

They didn't mention availability sets, they mentioned scale set i.ei. VM scale set. It lets you create and manage group of identical VMs. Scale sets are not for fault tolerance but more for management.
upvoted 2 times

  **Georgess** 1 year, 11 months ago
Answer is B, BUT Availability set it's not the same thing to Scale set.
upvoted 1 times

  **Moon**  3 years, 10 months ago
answer is "No / B".
Virtual Machine Scale Sets let you create and manage a group of identical, load balanced VMs. The number of VM instances can automatically increase or decrease in response to demand or a defined schedule.
What provide Data Center fault tolerant, is "Availability Set".
upvoted 24 times

  **thomasemr** 3 years, 4 months ago
Availability Zones.
upvoted 7 times

  **Pinha**  8 months, 3 weeks ago
- Scale sets: Scale sets are a feature in Azure that allows you to create and manage a group of identical, load balanced VMs. Scale sets provide high availability and auto-scale capabilities, and they are an effective way to ensure that your services are always available and running optimally.

- Availability sets: Availability sets are a feature in Azure that helps ensure the availability of your virtual machines (VMs) by distributing them across multiple physical servers, switches, and storage units. When you create an availability set, you can specify the number of VMs that you want in the set, and Azure will automatically distribute them across multiple physical resources to ensure that they are available in the event of a failure. Availability sets are designed to provide 99.95% uptime for two or more VMs in the same availability set, which means that your VMs are expected to be available at least 99.95% of the time.

The answer is B.
upvoted 2 times

  **_Juliemol13** 3 months, 1 week ago
Availability set is hardware protection in the data center that is hosting your VM.
Scale set is an increase resource for your workload on a set of VMS, which provisions more instances according to pre-defined metrics.

Question #123

Topic 1

You need to be notified when Microsoft plans to perform maintenance that can affect the resources deployed to an Azure subscription. What should you use?

- A. Azure Monitor
- B. Azure Service Health
- C. Azure Advisor
- D. Microsoft Trust Center

Correct Answer: B

Azure Service Health provides a personalized view of the health of the Azure services and regions you're using. This is the best place to look for service impacting communications about outages, planned maintenance activities, and other health advisories because the authenticated Service Health experience knows which services and resources you currently use.

The correct answer is B. Azure Service Health.

Azure Service Health is a feature in Azure that helps you stay informed about the availability of the Azure services that you are using, and provides guidance when planned and unplanned maintenance events may affect those services. You can use Azure Service Health to get notifications about planned maintenance events that may affect your resources, as well as to view the current and past health status of the Azure services in your subscription.

By using Azure Service Health, you can proactively plan for maintenance events and take appropriate action to minimize any potential impact on your resources and workloads.

Question #124

Topic 1

DRAG DROP -

Match the Azure Services service to the correct description.

Instructions: To answer, drag the appropriate service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.

NOTE: Each correct selection is worth one point.

Select and Place:

Services	Answer Area
Azure Sphere	A managed service that provides bidirectional communication between IoT devices and Azure
IoT Central	A fully managed software as a service (SaaS) solution to connect, monitor, and manage IoT devices at scale
IoT Hub	A software and hardware solution that provides communication and security features for IoT devices

Correct Answer:

Services	Answer Area
	IoT Hub A managed service that provides bidirectional communication between IoT devices and Azure
	IoT Central A fully managed software as a service (SaaS) solution to connect, monitor, and manage IoT devices at scale
	Azure Sphere A software and hardware solution that provides communication and security features for IoT devices

Create an IoT hub
In this section, you use Azure CLI to create an IoT hub and a resource group. An Azure resource group is a logical container into which Azure resources are deployed and managed. An IoT hub acts as a central message hub for bi-directional communication between your IoT application and the devices.
upvoted 1 times

  **Bereket** 8 months, 1 week ago

IoT Central is an IoT application platform as a service (aPaaS) that reduces the burden and cost of developing, managing, and maintaining IoT solutions. Use IoT Central to quickly evaluate your IoT scenario and assess the opportunities it can create for your business. IoT Central streamlines the development of a complex and continually evolving IoT infrastructure by letting you to focus your efforts on determining the business impact you can create with the IoT data stream.
The web UI lets you quickly connect devices, monitor device conditions, create rules, and manage devices and their data throughout their life cycle. Furthermore, it enables you to act on device insights by extending IoT intelligence into line-of-business applications. Once you've used IoT Central to evaluate your IoT scenario, you can then build your enterprise ready solutions by using the power of Azure IoT platform.

The Azure Migrate: Discovery and assessment tool discovers and assesses on-premises VMware VMs, Hyper-V VMs, and physical servers for migration to Azure. Here's what the tool does: Azure readiness: Assesses whether on-premises servers, SQL Servers and web apps are ready for migration to Azure.

Total cost of ownership - (TCO) is an estimation of the expenses associated with purchasing, deploying, using and retiring a product or piece of equipment.

The Data Migration Assistant - (DMA) helps you upgrade to a modern data platform by detecting compatibility issues that can impact database functionality in your new version of SQL Server or Azure SQL Database.

Azure Pricing Calculator - It is a tool provided by Microsoft that allows users to estimate the cost of using Azure services. It allows users to select the services they plan to use, specify the configuration and usage details, and then calculate the estimated cost based on the current prices for those services.

Question #127

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
You can use Availability Zones in Azure to protect Azure virtual machines from a datacenter failure.	☐	☐
You can use Availability Zones in Azure to protect Azure virtual machines from a region failure.	☐	☐
You can use Availability Zones in Azure to protect Azure managed disks from a datacenter failure.	☐	☐

Answer Area

Statements	Yes	No
You can use Availability Zones in Azure to protect Azure virtual machines from a datacenter failure.	☒	☐
You can use Availability Zones in Azure to protect Azure virtual machines from a region failure.	☐	☒
You can use Availability Zones in Azure to protect Azure managed disks from a datacenter failure.	☒	☐

Correct Answer:

Availability zones expand the level of control you have to maintain the availability of the applications and data on your VMs. Availability Zones are unique physical locations within an Azure region. Each zone is made up of one or more datacenters equipped with independent power, cooling, and networking. To ensure resiliency, there are a minimum of three separate zones in all enabled regions. The physical separation of Availability Zones within a region protects applications and data from datacenter failures.

With Availability Zones, Azure offers industry best 99.99% VM uptime SLA. By architecting your solutions to use replicated VMs in zones, you can protect your applications and data from the loss of a datacenter. If one zone is compromised, then replicated apps and data are instantly available in another zone.

  **fspelllet** Highly Voted 2 years, 5 months ago

Availability Zone: Unique physical locations within a region. Each zone is made up of one or more datacenters equipped with independent power, cooling, and networking.

So this is why the third question is yes, because your data will likely be stored in more than one data center, so if a data center goes down, it's highly likely another data center in the zone will have a backup and will move the activity to that location. This is what they mean by "fault tolerance" as well.

upvoted 28 times

  **Stopblindlytrustingchatbot** 1 month, 3 weeks ago

Fault tolerance is protection against a system failure (e.g. faulty power strip), not a whole data center. Redundant power sources would be an example of fault tolerance.

upvoted 1 times

  **Harry28731** 1 year, 9 months ago

No, some zones can have only one Datacenter so your "likelihood" is not the reason for the 3rd answer to be YES but rather the managed disk availability options :

<https://docs.microsoft.com/en-us/azure/virtual-machines/disks-redundancy>

Zone-redundant storage (ZRS) synchronously replicates your Azure managed disk across three Azure availability zones in the region you select. Each availability zone is a separate physical location with independent power, cooling, and networking.

A ZRS disk lets you recover from failures in availability zones. If a zone went down, a ZRS disk can be attached to a virtual machine (VM) in a different zone

Yes No Yes

upvoted 1 times

  **u2637ps** 1 year, 4 months ago

In the broadest terms you can use availability zones for disk storage but this is seperate from an availability zone in its strictess sense. It depends on how liberally you interpret the question

upvoted 1 times

  **RightAnswers** 1 year, 5 months ago

A. No

B. Yes

C. Yes. Azure managed disks offer two storage redundancy options, zone-redundant storage (ZRS), and locally-redundant storage. Locally-redundant storage (LRS) replicates your data three times within a single data center in the selected region. Zone-redundant storage (ZRS) synchronously replicates your Azure managed disk across three Azure availability zones in the region you select. Each availability zone is a separate physical location with independent power, cooling, and networking. So, by using ZRS (means using multiple AZs you can protect Managed Disks from data center failure).

upvoted 4 times

  **RightAnswers** 1 year, 5 months ago

Correction...

A. Yes

B. No

C. Yes.

upvoted 5 times

  **cormorant** 1 year, 6 months ago

if a region goes down, all availability zones within it go off

upvoted 2 times

  **Gwin300** 1 year, 6 months ago

The thing with this question is that it is NOT properly word or framed.

the question should be said in this this way ..."you can use Availabilty zone to prevent YOUR company's Azure VM from a data center failure drives home the point more readily than saying ...you can use Availability zone to prevent a VM from a data center failure.

in this second senario, it could as well means VMs in azure that aren't mine or related to my company

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
An Azure subscription can have multiple account administrators	☐	☐
An Azure subscription can be managed by using a Microsoft account only	☐	☐
An Azure resource group can contain multiple Azure subscriptions	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
An Azure subscription can have multiple account administrators	☐	☒
An Azure subscription can be managed by using a Microsoft account only	☒	☐
An Azure resource group can contain multiple Azure subscriptions	☐	☒

Box 1: No -

A subscription can have multiple administrators, but there can only be one account administrator.

Box 3: No -

A subscription can contain multiple resource groups but a resource group can only belong to one subscription. Resource groups can contain multiple resources.

Reference:

<https://k21academy.com/microsoft-azure/az-900/az-900-azure-subscriptions/> <https://azure.microsoft.com/en-us/blog/organizing-subscriptions-and-resource-groups-within-the-enterprise/>

 **emi502** Highly Voted 2 years, 7 months ago

1. Yes - You can assign additional account administrators in the Azure Portal.
 2. No - You need an Azure Active Directory account to manage a subscription, not a Microsoft account. An account is created in the Azure Active Directory when you create the subscription. Further accounts can be created in the Azure Active Directory to manage the subscription
 3. No. Resource groups are logical containers for Azure resources. However, resource groups do not contain subscriptions. Subscriptions contain resource groups.

There can only be one Service Administrator per Azure subscription

B. Yes

Do I need a Microsoft account to sign up for Azure? You can sign up with your Microsoft account, or you can use your GitHub account and take your code all the way from repositories to deployment.

<https://azure.microsoft.com/en-us/free/free-account-faq>

1. Customer Account ID: 635786

2. Customer Company Name: Performance Health

3. Customer Contact Name: WILLIAMS, JOHN

C. No

An Azure resource group cannot contain subscriptions.

<https://social.msdn.microsoft.com/Forums/en-US/e4e54c00-60c2-4a79-af0c-5ad022b8097c/an-azure-resource-group-contains-multiple-subscription-true-or-false?forum=windowsazuremanagement>

upvoted 60 times

🗨️ 👤 **Dikkie** 2 years, 6 months ago

If you read further they actually say that you need a Microsoft Account:

How does the signup process work using GitHub?

You can now sign up using the "Sign-in options" link on the Azure sign-in page. When you, as a GitHub user, first sign into a Microsoft product with your credentials, GitHub will ask for your permission to consent. GitHub will share with Microsoft the name and public and private email addresses on your GitHub account to check if you already have a Microsoft account. If it looks like you already have an account, you'll have the option to use that account and add your GitHub account as a login method. Otherwise, a new account will be created and linked to the GitHub account.

upvoted 5 times

🗨️ 👤 **Dikkie** 2 years, 6 months ago

If it looks like you already have an account, you'll have the option to use that account and add your GitHub account as a login method.

Otherwise, a new account will be created and linked to the GitHub account.

🗨️ 👤 **Joe75** 2 years, 7 months ago

A is now Yes. No, was valid for "classic administrators".

upvoted 8 times

  **semauni** 4 months ago

It is a classic role indeed, but that is still the only "Account Administrator". And it specifically says, 'limited to 1' in this table:

<https://learn.microsoft.com/en-us/azure/role-based-access-control/rbac-and-directory-admin-roles#classic-subscription-administrator-roles>

upvoted 1 times

  **LA_AL** 5 months, 3 weeks ago

no you cant

<https://learn.microsoft.com/en-us/azure/role-based-access-control/classic-administrators>

upvoted 1 times

  **Harry28731** 1 year, 9 months ago

SECOND QUESTION IS NO !

Microsoft account is a special definition in Microsoft it's like your personal account to access outlook, skype, xbox360 consumer-related product. You can access azure AD as a guest user using Azure B2B collaboration service and a work/school account. Check here :

<https://docs.microsoft.com/en-us/azure/active-directory/external-identities/azure-ad-account>

Even Google ! By setting up federation with Google, you can allow invited users to sign in to your shared apps and resources with their own Gmail accounts, without having to create Microsoft accounts.

And to manage the subscription, grant them the owner role.

upvoted 6 times

  **idioteque** 1 year, 1 month ago

B. NO

I can access Azure with my company email which is not a Microsoft account. Btw, I was given access as one of the co-admin.

upvoted 3 times

  **Veerti** Most Recent 2 weeks, 4 days ago

Appeared in my exam - 4/9/23

upvoted 2 times

  **Noble_Fart** 2 months ago

ChatGPT FTW:

An Azure subscription can be managed by using either a Microsoft account or a work/school account from Azure Active Directory (Azure AD).

A Microsoft account refers to personally created accounts, like those created for accessing services like Outlook.com, Xbox Live, or Skype.

In a business environment, you'd typically use a work or school account that exists in Azure AD. This allows for greater control and management features, especially in an enterprise setting. These features can include things like conditional access policies, multi-factor authentication, role-based access control (RBAC), and more.

In many cases, businesses choose to manage their Azure subscriptions using Azure AD accounts as it allows for advanced management and security features. This does not mean that Microsoft accounts can't be used, but they're often less suitable for managing resources in a business or enterprise environment.

  **Stopblindlytrustingchatbot** 1 month, 3 weeks ago

Don't blindly trust chat bots

upvoted 1 times

  **ltp1120** 2 months ago

It's in Q#107 - N/N/N

Box 1: No

You can assign service administrators and co-administrators in the Azure Portal but there can only be one account administrator.

Box 2: No

You need an Azure Active Directory account to manage a subscription, not a Microsoft account. An account is created in the Azure Active Directory when you create the subscription. Further accounts can be created in the Azure Active Directory to manage the subscription.

Box 3: No

Resource groups are logical containers for Azure resources. However, resource groups do not contain subscriptions. Subscriptions contain resource groups.

upvoted 3 times

  **oopspruu** 2 months ago

Answer to Box 2 is NO. The reason is, MS considers a personal/home account as a "Microsoft Account", whereas an AAD account is officially considered "Work or School Account". So the answer is NO since both a MS Account and Work/school AAD accounts can be used to manage Azure subs.

upvoted 2 times

  **ANKITA910** 2 months ago

  **Amycert** 4 months ago

no/no/no
this question is repeated
upvoted 2 times

  **semauni** 4 months ago

I noticed a lot of the comments are old and confusing. This is what I've looked up in 2023, and what I think the answers are today:
1) No. The table from the link explicitly states "1 per account". Source: <https://learn.microsoft.com/en-us/azure/role-based-access-control/rbac-and-directory-admin-roles#classic-subscription-administrator-roles>
2) Yes. "To gain access to the Microsoft Azure management portal, you must have an Azure subscription and a Microsoft account associated with that subscription." Source: <https://learn.microsoft.com/en-us/dynamics-nav/how-to--sign-up-for-a-microsoft-azure-subscription>
3) No. The hierarchy is subscription --> resource groups, not the other way around. A subscription can contain multiple resource groups, but a resource group can only be part of one subscription. This is covered in one of the modules.
upvoted 5 times

  **yyu667** 4 months, 1 week ago

If you look at the page where you add Admin account on portal, there is no provision to add multiple account amdins

<https://learn.microsoft.com/en-us/azure/role-based-access-control/classic-administrators>
upvoted 1 times

  **cybwear** 4 months, 2 weeks ago

B is also no. Azure subscription can be managed by different types of accounts, including Microsoft accounts, work or school accounts (Azure Active Directory), and service principals (used for automation and programmatic access).
upvoted 1 times

  **semauni** 4 months ago

Aren't Azure AD accounts also Microsoft accounts?
upvoted 1 times

  **mimi23** 4 months, 2 weeks ago

2. Yes. You can access it using ONLY a Microsoft account or using a work/school account.
<https://learn.microsoft.com/en-us/azure/active-directory/fundamentals/sign-up-organization>
upvoted 1 times

  **Berni** 5 months ago

regarding B (from ChatGPT):
The question as written implies that a Microsoft account is the only option for managing an Azure subscription, which is not entirely accurate. So the answer would be "False."

While a Microsoft account is one option for managing an Azure subscription, it is not the only option. Azure also supports other authentication methods, such as work or school accounts associated with an Azure AD tenant, as well as federated identity providers.

Question #131

Topic 1

You plan to deploy several Azure virtual machines.

You need to ensure that the services running on the virtual machines remain available if a single data center fails.

What are two possible solutions? Each correct answer presents a complete solution.

- A. Deploy the virtual machines to two or more availability zones.
- B. Deploy the virtual machines to two or more resource groups.
- C. Deploy the virtual machines to a scale set.
- D. Deploy the virtual machines to two or more regions.

Correct Answer: AD

Question #132

Topic 1

HOTSPOT -

To complete the sentence, select the appropriate option in the answer area.

Hot Area:

Answer Area

You plan to deploy 20 virtual machines to an Azure environment. To ensure that a virtual machine named VM1 cannot connect to the other virtual machines, VM1 must

- be deployed to a separate virtual network.
- run a different operating system than the other virtual machines.
- be deployed to a separate resource group.
- have two network interfaces.

Correct Answer:

Answer Area

You plan to deploy 20 virtual machines to an Azure environment. To ensure that a virtual machine named VM1 cannot connect to the other virtual machines, VM1 must

- be deployed to a separate virtual network.
- run a different operating system than the other virtual machines.
- be deployed to a separate resource group.
- have two network interfaces.

Azure automatically routes traffic between subnets in a virtual network. Therefore, all virtual machines in a virtual network can connect to the other virtual machines in the same virtual network. Even if the virtual machines are on separate subnets within the virtual network, they can still communicate with each other.

To ensure that a virtual machine cannot connect to the other virtual machines, the virtual machine must be deployed to a separate virtual network.

Question #133

Topic 1

DRAG DROP -

Match the Azure service to the appropriate description.

To answer, drag the appropriate service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.

NOTE: Each correct match is worth one point.

Select and Place:

Services

Azure Cosmos DB

Azure HDInsight

Azure Synapse Analytics

Answer Area

A fully managed data warehouse that has integral security at every level of scale at no extra cost.

A globally distributed database that supports NoSQL.

Managed Apache Hadoop clusters in the cloud that enable you to process massive amounts of data.

Correct Answer:

Services

Answer Area

Azure Synapse Analytics

A fully managed data warehouse that has integral security at every level of scale at no extra cost.

Azure Cosmos DB

A globally distributed database that supports NoSQL.

Azure HDInsight

Managed Apache Hadoop clusters in the cloud that enable you to process massive amounts of data.

 **xian05** Highly Voted 2 years ago

Memorise:

azure synapse analytics = Warehouse

Azure cosmos = even larger than the globe (global) : cosmos

Azure HDInsight = HaDooP

Azure synapse analytics used to be called Azure SQL Data Warehouse

<https://azure.microsoft.com/en-us/blog/azure-sql-data-warehouse-is-now-azure-synapse-analytics/>

Azure cosmos is the only database that supports NoSQL.

<https://www.sqlshack.com/learn-nosql-in-azure-an-overview-of-azure-cosmos-db/>

Azure HDInsight :

Question #134

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
The Archive access tier is set at the storage account level.	☐	☐
The Hot access tier is recommended for data that is accessed and modified frequently.	☐	☐
The Cool access tier is recommended for long term backups.	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
The Archive access tier is set at the storage account level.	☐	☒
The Hot access tier is recommended for data that is accessed and modified frequently.	☒	☐
The Cool access tier is recommended for long term backups.	☐	☒

Box 2: Yes -

Usage scenarios for the hot access tier include:

Data that is in active use or is expected to be read from and written to frequently

Data that is staged for processing and eventual migration to the cool access tier

Box 3: No -

Usage scenarios for the cool access tier include:

Short-term backup and disaster recovery

Older data not used frequently but expected to be available immediately when accessed

Large data sets that need to be stored cost effectively, while more data is being gathered for future processing

▪

- DevTony

Highly Voted

1 year, 11 months ago

The answer of 1st question should be NO.

from Azure document: "Only the hot and cool access tiers can be set at the account level. The archive access tier can only be set at the blob level."

Please see: <https://docs.microsoft.com/en-us/azure/storage/blobs/storage-blob-storage-tiers>

upvoted 120 times
- Harry28731

1 year, 9 months ago

yes indeed. From the Azure Portal :

The account access tier is the default tier that is inferred by any blob without an explicitly set tier. The hot access tier is ideal for frequently accessed data, and the cool access tier is ideal for infrequently accessed data. The archive access tier can only be set at the blob level and not on the accoun

From your link :

The Archive tier is not supported as the default access tier for a storage account.

upvoted 15 times

  **Stopblindlytrustingchatbot** 1 month, 3 weeks ago

It doesn't make sense to me why there would be a storage tier at the account level that does not include archive tier, is it because Microsoft does not want accounts that are dedicated 100% to archival (since they make money on usage/data storage and transfer)?

Question #135

Topic 1

What is the most severe failure from which an Azure Availability Zone can be used to protect access to Azure service?

- A. a physical server failure
- B. an Azure region failure
- C. a storage failure
- D. an Azure data center failure

Correct Answer: D

Availability zones expand the level of control you have to maintain the availability of the applications and data on your VMs. An Availability Zone is a physically separate zone, within an Azure region. There are three Availability Zones per supported Azure region.

Each Availability Zone has a distinct power source, network, and cooling. By architecting your solutions to use replicated VMs in zones, you can protect your apps and data from the loss of a datacenter. If one zone is compromised, then replicated apps and data are instantly available in another zone.

- Palack

1 year, 5 months ago

Selected Answer: D

Each availability zone is made up of one or more datacenters with independent power, cooling, and networking. So this, in its own doesn't guarantee data center redundancy.

But: Availability zones and their associated datacenters are designed such that if one zone is compromised, the services, capacity, and availability are supported by the other availability zones in the region.

Correct Answer:

Serverless Solutions

Answer Area

Azure Functions

Executes code:

Azure Functions

Azure Logic Apps

Is always stateful:

Azure Functions

Runs only in the cloud:

Azure Logic Apps

Box 1: Azure Functions -

Azure Functions allows you to implement your system's logic into readily available blocks of code called "functions". Different functions can run anytime you need to respond to critical events.

Box 2: Azure Functions -

Azure Logic Apps can have multiple stateful and stateless workflows.

Box 3: Azure Logic Apps -

Azure Logic Apps is a cloud-based platform for creating and running automated workflows that integrate your apps, data, services, and systems.

Reference:

Runs only in cloud - Azure Logic Apps

Check Function vs Logic app

<https://learn.microsoft.com/en-us/training/modules/azure-compute-fundamentals/azure-functions?ns-enrollment-type=LearningPath&ns-enrollment-id=learn.az-900-describe-core-azure-services>
upvoted 2 times

  **j3ffrey** 8 months, 1 week ago
Azure Logic Apps can only be built and run inside Azure. This is because they are fully managed in Azure where you deploy your JSON workflow.

As a result, you cannot run, debug, or test your workflows outside the Azure datacenters. On the other hand, Azure Function Apps can be developed and run locally on any self-managed server.
upvoted 1 times

  **azirila** 8 months, 1 week ago
Executes Code - Azure Functions
Is Stateful - Azure Logic Apps Azure Fubction can be stateful but Logic Apps is default stateful!
Runs only in cloud - Azure Logic Apps

You can mix and match services when you build an orchestration, calling functions from logic apps and calling logic apps from functions. Here are some common differences between the two.

Functions

Logic Apps

State

Normally stateless, but Durable Functions provide state.

Stateful.
upvoted 1 times

  **lombri** 8 months, 3 weeks ago
When creating serverless applications with ((Azure Functions)), your operations will typically be designed to run in a ((stateless)) manner.

An Availability Zone in Azure has physically separate locations

▼

across two continents

within a single Azure region

within multiple Azure regions

within a single Azure datacenter

Answer Area

Correct Answer: An Availability Zone in Azure has physically separate locations

▼

across two continents

within a single Azure region

within multiple Azure regions

within a single Azure datacenter

Box: within a single Azure region

Azure availability zones are physically separate locations within each Azure region that are tolerant to local failures.

Reference:

<https://docs.microsoft.com/en-us/azure/availability-zones/az-overview>

Dtex69 6 months, 3 weeks ago

Same as before I don't think this is correct. Availability zones (plural) have separate locations within a region. An availability zone (singular) has separate locations within a data centre.

upvoted 2 times

semauni 4 months ago

Within an availability zone, there are one or more physically separate data centres. The exact wording has been quoted in questions before this one. There are multiple availability zones within a region. Don't confuse a data centre, availability zone and a region :)

upvoted 1 times

Dtex69 6 months, 3 weeks ago

... although an availability zone is one or more datacentres - another badly worded question. Sometimes the exact wording is important and other times it's not ... go figure!

Question #140

Topic 1

DRAG DROP -

Match the Azure services to the correct descriptions.

Instructions: To answer, drag the appropriate Azure service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.

NOTE: Each correct match is worth one point.

Select and Place:

Services	Answer Area	
Azure Functions		Provide operating system virtualization.
Azure App Service		Provide portable environment for virtualized applications.
Azure virtual machines		Used to build, deploy, and scale web apps.
Azure Container Instances		Provide a platform for serverless code.

	Services	Answer Area	
Correct Answer:	Azure Functions	Azure virtual machines	Provide operating system virtualization.
	Azure App Service	Azure Container Instances	Provide portable environment for virtualized applications.
	Azure virtual machines	Azure App Service	Used to build, deploy, and scale web apps.
	Azure Container Instances	Azure Functions	Provide a platform for serverless code.

Box 1: Azure virtual machines -

Box 2: Azure Container instances

Azure Container Instances (ACI) is a managed service that allows you to run containers directly on the Microsoft Azure public cloud, without requiring the use of virtual machines (VMs).

Develop apps fast without managing virtual machines or having to learn new tools – it's just your application, in a container, running in the cloud.

Box 3: Azure App Service -

Azure App Service is a fully managed platform for building web applications.

Applications run and scale with ease on both Windows and Linux-based environments.

Box 4: Azure Functions -

Azure Functions (from Microsoft Azure) is a cloud-based serverless service that allows running event-triggered code in a scalable way without providing or managing infrastructure.

Reference:

<https://docs.microsoft.com/en-us/azure/container-instances>

<https://azure.microsoft.com/en-us/services/app-service/>

<https://revdebug.com/blog/what-are-azure-functions>

 **jullian** Highly Voted 9 months, 2 weeks ago

The given answer is incorrect.

1. Azure Container Instances: Provide operating system virtualization
2. Azure Container Instances: Provide portable environment for virtualized applications
3. Azure App Service: Used to build, deploy, and scale web apps.
4. Azure Functions: Provide a platform for serverless code.

For 1 and 2, as a general rule of thumb:

- VMs virtualize the Hardware
- Containers virtualize the OS

Source: <https://youtu.be/c4TlgSi1Vbg>

Please note that an answer can be used once, more than once, or none at all.

Question #141

Topic 1

HOTSPOT -

To answer, select the appropriate option in the answer area.

Hot Area:

Answer Area

You have several virtual machines in an Azure subscription. You create a new subscription.

The virtual machines cannot be moved to the new subscription.
The virtual machines can be moved to the new subscription.
The virtual machines can be moved to the new subscription only if they are all in the same resource group.
The virtual machines can be moved to the new subscription only if they run Windows Server 2019.

Answer Area

You have several virtual machines in an Azure subscription. You create a new subscription.

Correct Answer:

The virtual machines cannot be moved to the new subscription.
The virtual machines can be moved to the new subscription.
The virtual machines can be moved to the new subscription only if they are all in the same resource group.
The virtual machines can be moved to the new subscription only if they run Windows Server 2019.

Box: The virtual machines can be moved to the new subscription.

You can move a VM and its associated resources to a different subscription by using the Azure portal.

Note: Repeat the process below for each Resource Group containing the VMs.

1. Go to the Azure portal to manage the resource group containing the VM to move. Search for and select Resource groups.
2. Choose the resource group containing the VM that you would like to move.
3. At the top of the page for the resource group, select Move and then select Move to another subscription. The Move resources page opens.
4. Select each of the resources to move. In most cases, you should move all of the related resources that are listed.
5. Select the Subscription where you want the VM to be moved.
6. Select an existing Resource group, or enter a name to have a new resource group created.
7. When you are done, select that you understand that new resource IDs will be created and that the new IDs will need to be used with the VM after it is moved, and then select OK.

Question #142

Topic 1

You need to purchase a third-party virtual security appliance that you will deploy to an Azure subscription.
What should you use?

- A. Azure subscriptions
- B. Microsoft Defender for Cloud
- C. Azure Marketplace
- D. Microsoft Store

Correct Answer: C

You can access these enhanced network security features by using an Azure partner solution. You can find the most current Azure partner network security solutions by visiting the Azure Marketplace, and searching for "security" and "network security."

Some third-party reseller services available on Azure Marketplace now consume your Enterprise Agreement (EA) Azure Prepayment balance.

Question #144

Topic 1

You plan to deploy a service to Azure virtual machines.

You need to ensure that the service will be available if a datacenter fails.

What should you use as part of the virtual machine deployment?

- A. availability sets
- B. proximity placement groups
- C. host groups
- D. availability zones

Correct Answer: D

Azure availability zones are physically separate locations within each Azure region that are tolerant to local failures. Failures can range from software and hardware failures to events such as earthquakes, floods, and fires. Tolerance to failures is achieved because of redundancy and logical isolation of Azure services. To ensure resiliency, a minimum of three separate availability zones are present in all availability zone-enabled regions.

Availability sets are inside a single data center. If that data center fails, so do the availability sets.

upvoted 3 times
- Peca

12 months ago

No, because Availability Sets are logical grouping of applications, and not VMs.

upvoted 5 times
- jrop

11 months, 1 week ago

Actually availability sets are use it to manage load balanced vms, but it no refears redundancy, this case is for redundancy, so, availability zones is te answer

upvoted 2 times
- Hoeishetmogelijk

8 months, 2 weeks ago

Availability zones are unique physical locations within an Azure region. Availability zones and their associated datacenters are designed such that if one zone is compromised, the services, capacity, and availability are supported by the other availability zones in the region.

An availability set is a logical grouping of VMs that allows Azure to understand how your application is built to provide for redundancy and availability.

Azure Virtual Machine Scale Sets let you create and manage a group of load balanced VMs.

Azure Policy is the answer.

Explanation: Azure Policy evaluates resources and actions in Azure by comparing the properties of those resources to business rules. These business rules, described in JSON format, are known as policy definitions. To simplify management, several business rules can be grouped together to form a policy initiative (sometimes called a policySet). Once your business rules have been formed, the policy definition or initiative is assigned to any scope of resources that Azure supports, such as management groups, subscriptions, resource groups, or individual resources. The assignment applies to all resources within the Resource Manager scope of that assignment. Subscopes can be excluded, if necessary. For more information, see Scope in Azure Policy.

Question #146

Topic 1

HOTSPOT -

Select the answer that correctly completes the sentence.

Hot Area:

Answer Area

An Azure region

	▼
contains one or more data centers that are connected by using a low-latency network.	
is found in each country where Microsoft has a subsidiary office.	
can be found in every country in Europe and the Americas only.	
contains one or more data centers that are connected by using a high-latency network.	

Answer Area

Correct Answer: An Azure region

	▼
contains one or more data centers that are connected by using a low-latency network.	
is found in each country where Microsoft has a subsidiary office.	
can be found in every country in Europe and the Americas only.	
contains one or more data centers that are connected by using a high-latency network.	

Box: contains one or more data centers that are connected by using a low-latency network.

Each Azure region features datacenters deployed within a latency-defined perimeter. They're connected through a dedicated regional low-latency network. This design ensures that Azure services within any region offer the best possible performance and security.

Question #148

Topic 1

What is the function of a Site-to-Site VPN?

- A. provides a secure connection between a computer on a public network and the corporate network
- B. provides a dedicated private connection to Azure that does NOT travel over the internet
- C. provides a connection from an on-premises VPN device to an Azure VPN gateway

Correct Answer: C

A Site-to-Site VPN gateway connection is used to connect your on-premises network to an Azure virtual network over an IPsec/IKE (IKEv1 or IKEv2) VPN tunnel.

This type of connection requires a VPN device located on-premises that has an externally facing public IP address assigned to it.

Example:

uclacyc 10 months, 2 weeks ago

Selected Answer: C

Sort of a bad question. Should be asking "Site-to-Site VPN gateway connection," not Site-to-Site VPN," though key phrase here is "Site-to-Site." If it were just "What is a VPN, then "A" would be correct, but in this case, "Site-to-Site" pertains to datacenter-to-datacenter, so "C" is the most correct answer.

upvoted 5 times

kamal_004 11 months, 3 weeks ago

Answer C. provides a connection from an on-premises VPN device to an Azure VPN gateway

Azure App Service >> Platform as a Service (PaaS)
>> Azure App Service is considered an excellent Platform as a Service (PaaS), offering an application platform for developers to build Web, mobile and API applications. Its offerings range from simple marketing and digital presence applications to scalable e-commerce solutions and hyper-scale, customizable applications
Azure Virtual machines >> Infrastructure as a Service (IaaS)
Microsoft Dynamics 365 >> Software as a Service (SaaS)
Typically, a SaaS provider opts to license applications to you as an on demand offering or as a subscription service. Popular examples are things like: Microsoft Dynamics CRM, Office 365 and Dropbox

This should be SAAS, IAAS and PAAS
upvoted 1 times

  **vcehung** 1 year ago

dynamic 365 could be saas or paas depends on licensing model:
<https://dynamicsblog.intersys.pl/en/2021/10/22/modele-licencyjne-microsoft-dynamics-365-business-central-on-premise-vs-saas-vs-paas-vs-iaas/>

but here it should be saas in general
so i think it is correct

upvoted 2 times

DRAG DROP -

Match the cloud service models to the appropriate solutions.

To answer, drag the appropriate cloud service model from the column on the left to its solution on the right Each cloud service model may be used once, more than once, or not at all.

NOTE: Each correct match is worth one point.

Select and Place:

Infrastructure-as-a-Service (IaaS)

Platform-as-a-Service (PaaS)

Software-as-a-Service (SaaS)

Answer Area

A cloud-based file server

A cloud-based accounting system

A cloud-based service for custom apps

Correct Answer:

Infrastructure-as-a-Service (IaaS)

Platform-as-a-Service (PaaS)

Software-as-a-Service (SaaS)

Answer Area

Infrastructure-as-a-Service (IaaS)

A cloud-based file server

Software-as-a-Service (SaaS)

A cloud-based accounting system

Platform-as-a-Service (PaaS)

A cloud-based service for custom apps

Box 1: Infrastructure as a service (IaaS)

Azure Files is a simple, secure, and serverless enterprise-grade cloud file shares.

Infrastructure as a service (IaaS) is a type of cloud computing service that offers essential compute, storage, and networking resources on demand, on a pay-as- you-go basis.

Box 2: Software as a service (SaaS)

Dynamics 365 is a set of interconnected, modular Software-as-a-Service (SaaS) applications and services designed to both transform and enable your core customers, employees, and business activities. It includes Dynamics 365 Finance: use the guided, rules-based chart of accounts and no-code configuration service to simplify regulatory reporting, electronic invoicing, and global payments.

Box 3: Platform as a service (PaaS)

Platform as a service (PaaS) is a complete development and deployment environment in the cloud, with resources that enable you to deliver everything from simple cloud-based apps to sophisticated, cloud-enabled enterprise applications.

  **buiducvu** Highly Voted 9 months ago
Correct
upvoted 11 times

  **vanith** Most Recent 3 months, 1 week ago
It's correct because,
1. IaaS - the cloud-based file server would provide the infrastructure components necessary for file storage and retrieval, such as servers, storage devices, and networking resources. Users would typically have more control and flexibility over the operating system, file system, and software installed on the server.
2. SaaS - the accounting software is provided as a fully managed service over the internet. Users can access the software through a web browser or a client application without the need for local installation or maintenance.
3. PaaS - the cloud provider offers a platform that allows developers to build, deploy, and manage custom applications without having to worry about the underlying infrastructure. This platform typically includes development tools, programming languages, libraries, and frameworks to facilitate the app development process.

  **K2001** 1 year ago
Is anyone able to verify that SaaS is the correct answer for the second box? The question does not ask if Dynamics 365 is SaaS, IaaS, or PaaS, it just asks which a "cloud-based accounting system" would be. To my way of thinking, any such cloud based system--other than Microsoft specific services--would be PaaS. Therefore the answer for the second box is either wrong, or the question is deliberately too vague.
upvoted 2 times

  **Faren** 1 year ago

Yeah , SaaS, is deemed correct for the 2nd box, if you think about it, the accounting system is similar to a pre-built like 365. Again once of those where they wanna trick us.

Question #151

Topic 1

You need to manage containers.

Which two services can you use? Each correct answer presents a complete solution.

NOTE: Each correct selection is worth one point.

- A. Azure Virtual Desktop
- B. Azure virtual machines
- C. Azure Functions
- D. Azure Container Instances
- E. Azure Kubernetes Service (AKS)

Correct Answer: DE

Run Docker containers on-demand in a managed, serverless Azure environment. Azure Container Instances is a solution for any scenario that can operate in isolated containers, without orchestration. Run event-driven applications, quickly deploy from your container development pipelines, and run data processing and build jobs.

You can manage containers at scale with a fully managed Kubernetes container management and orchestration service that integrates with Azure Active Directory.

Azure Kubernetes Service is a robust and cost-effective container orchestration service that helps you to deploy and manage containerized applications in seconds where additional resources are assigned automatically without the headache of managing additional servers.

Reference:

<https://docs.microsoft.com/en-us/azure/container-instances/>

D. Azure Container Instances

E. Azure Kubernetes Service (AKS)

Azure Container Instances (ACI) provides a fast and simple way to run containers in Azure, without having to manage virtual machines or worry about infrastructure. ACI is a fully managed service that makes it easy to run containers, and you can quickly and easily deploy containers to Azure with a single command.

Azure Kubernetes Service (AKS) is a managed Kubernetes service that makes it easy to deploy, manage, and scale containerized applications in Azure. With AKS, you can quickly and easily create and manage a fully-managed Kubernetes cluster in Azure, which provides a scalable and highly available platform for running containers. AKS also integrates with other Azure services to provide a complete solution for managing containers in Azure.

Azure Virtual Desktop, Azure virtual machines, and Azure Functions are not services specifically designed for managing containers, although they can be used to run containers as part of a larger solution.

Question #152

Topic 1

HOTSPOT -

To complete the sentence, select the appropriate option in the answer area.

Hot Area:

Answer Area

When you need to delegate permissions to several Azure virtual machines simultaneously, you must deploy the Azure virtual machines

to the same Azure region.

by using the same Azure Resource Manager template.

to the same resource group.

to the same availability zone.

Correct Answer:

Answer Area

When you need to delegate permissions to several Azure virtual machines simultaneously, you must deploy the Azure virtual machines

to the same Azure region.

by using the same Azure Resource Manager template.

to the same resource group.

to the same availability zone.

A resource group is a logical container for Azure resources. Resource groups make the management of Azure resources easier. With a resource group, you can allow a user to manage all resources in the resource group, such as virtual machines, websites, and subnets. The permissions you apply to the resource group apply to all resources contained in the resource group.

Is it not possible to use an ARM template for the same purpose? Or is that not possible? Even though Azure Resource is the "better" option.

upvoted 16 times
- TitoChuz

1 year, 5 months ago

We cant set permitions on ARM templates according to my investigation.

One Important thing, We can't apply permission on Subscription level using ARM template. We can only apply permission on resource group and its resources.

<https://stackoverflow.com/questions/48284885/can-i-apply-permissions-through-an-arm-template#:~:text=One%20Important%20thing%2C%20We%20can%27t%20apply%20permission%20on,permission%20on%20resource%20group%20and%20its%20resources.%20Share>

upvoted 7 times
- clevermantmnd

2 years, 7 months ago

This is about permissions, not about VMs. So AZ Resource Group is the best answer. Moreoever, with AZ Resource, you can only delegate permission to that specific resource, not several VMs.

upvoted 11 times
- bytoki

2 years, 3 months ago

ARM template is for provisioning resources based on the config. This question is asking you to edit permissions for VMs that are already deployed.

upvoted 10 times
- alexandru_chirita

1 year, 10 months ago

It doesn't specify exactly that the virtual machines are already deployed. But I guess it is easier to move VMs to the same resource group and delegate permissions to the resource group.

I also consider the Azure Resource Manager delegating permissions because:
"When you onboard a customer to Azure Lighthouse, you use an Azure Resource Manager template along with a parameters file to define authorizations that grant access to delegated resources in the customer tenant. Each authorization specifies a principalId that corresponds to an Azure AD user, group, or service principal in the managing tenant, and a roleDefinitionId that corresponds to the Azure built-in role that will be granted."
<https://docs.microsoft.com/en-us/azure/lighthouse/how-to/deploy-policy-remediation>
upvoted 1 times

  **BabieTee** 2 years, 6 months ago

the point is simultaneously. With templates it is affected only when the other vms is been spinned. But with resource group , all permission is passed to all resources within the group at same time.

upvoted 28 times

  **VinnyMacD** Most Recent 1 month, 1 week ago

When you need to delegate permissions to several Azure virtual machines simultaneously, you must "deploy the Azure virtual machines"
Deploy - Means to create and setup a virtual machine. So these machines don't exist yet.
This means using "Same resource manager template" is the best option as the permission would be set while the machines are being created.
A Resource Manager template (usually written in JSON format) allows you to define and deploy a set of Azure resources together. This template can include the configuration for virtual machines, along with associated permissions and access control rules.

  **msmt** 2 months, 3 weeks ago

in the exam on 29jun2023

upvoted 1 times

  **orlandoryo** 6 months, 3 weeks ago

I initially thought it was ARM, but the keyword here is "simultaneously", so Resource Group is the way to go.

upvoted 3 times

  **JoeGuan** 6 months, 3 weeks ago

The azure resource template would allow you way more control. What if you need to deploy other 'things' in the resource group that do not require the same permissions? Plus, if the VMs need to be in different resource groups, but have the same permissions, then the template would allow you to apply permissions accordingly.

upvoted 1 times

  **rusttest** 7 months, 2 weeks ago

I thought you can only have one resource per resource group so how can you deploy several vm to a resource group
badly worded question.

upvoted 2 times

  **sideque** 6 months, 1 week ago

A resource group can contain multiple resources.
"A resource group is a container that holds related resources for an Azure solution. The resource group can include all the resources for the solution, or only those resources that you want to manage as a group."

Azure Resource Manager templates (ARM templates). The template is a JavaScript Object Notation (JSON) file that defines the infrastructure and configuration for your project. The template uses declarative syntax, which lets you state what you intend to deploy without having to write the sequence of programming commands to create it. In the template, you specify the resources to deploy and the properties for those resources.

Question #153

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You plan to deploy several Azure virtual machines.

You need to ensure that the services running on the virtual machines are available if a single data center fails.

Solution: You deploy the virtual machines to two or more availability zones.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: A

Availability zones expand the level of control you have to maintain the availability of the applications and data on your VMs. An Availability Zone is a physically separate zone, within an Azure region. There are three Availability Zones per supported Azure region.

Each Availability Zone has a distinct power source, network, and cooling. By architecting your solutions to use replicated VMs in zones, you can protect your apps and data from the loss of a datacenter. If one zone is compromised, then replicated apps and data are instantly available in another zone.

Question #154

Topic 1

This question requires that you evaluate the underlined text to determine if it is correct.

One of the benefits of Azure SQL Data Warehouse is that high availability is built into the platform.

Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed`. If the statement is incorrect, select the answer choice that makes the statement correct.

- A. No change is needed
- B. automatic scaling
- C. data compression
- D. versioning

Correct Answer: A

Azure Data Warehouse (now known as Azure Synapse Analytics) is a PaaS offering from Microsoft. As with all PaaS services from Microsoft, SQL Data Warehouse offers an availability SLA of 99.9%. Microsoft can offer 99.9% availability because it has high availability features built into the platform.

Question #155

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You plan to deploy several Azure virtual machines.

You need to ensure that the services running on the virtual machines are available if a single data center fails.

Solution: You deploy the virtual machines to two or more regions.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: A

By deploying the virtual machines to two or more regions, you are deploying the virtual machines to multiple datacenters. This will ensure that the services running on the virtual machines are available if a single data center fails.

Azure operates in multiple datacenters around the world. These datacenters are grouped in to geographic regions, giving you flexibility in choosing where to build your applications.

You create Azure resources in defined geographic regions like 'West US', 'North Europe', or 'Southeast Asia'. You can review the list of regions and their locations.

Within each region, multiple datacenters exist to provide for redundancy and availability.

 3 years, 11 months ago

Services are being discussed. Not all regions offer the same services; therefore, answer is B

upvoted 71 times
-   **semauni** 4 months ago

I think you're overthinking the question. It's simply: we have some services (you don't know which, and where), and if we were to deploy these to another region (again, you don't know where, but assuming that you don't dumbly pick a region where your services are not supported): would we be protected from a single data centre failure? I think the answer then is obviously YES.

upvoted 4 times
-   **JustSignalingVirtues** 1 year, 4 months ago

Question doesn't state all regions, you also have to remember that only in paired regions you will be able to replicate because they are setup same. So paired regions are redundant for availability purpose.

upvoted 4 times
-   **mrgilbe1** 1 year, 8 months ago

"Services running on the virtual machines". Azure is only supporting the VMs. The VMs are running the services, this is not related to any Azure services other than Virtual Machine support.

upvoted 13 times
-   **Amit0807** 3 years, 7 months ago

But the solution says you have deployed it in multiple regions hence it can be assumed that the services were available in other regions

upvoted 64 times
-   **Bond**

Highly Voted

 3 years, 11 months ago

i think what is required is best possible answer.. regions are NOT primarily designed for fault tolerance.

upvoted 44 times
-   **shishal** 2 years, 11 months ago

We may be overdoing it but regardless it meets the goal. May not be very cost effective or performant but that's not the goal here.

upvoted 31 times
-   **semauni** 4 months ago

Agreed. The question is not whether this is the best solution, it's about whether that solution works or not.

upvoted 1 times
-   **VIP_G** 1 year, 6 months ago

Agree. It meets the goal. This is literally what happened with AWS when the entire East region went down. Those companies that had multi-region deployment their sites did not go down. The rest of those folks took the rest of the day off.

upvoted 1 times

  **Molota** 4 months ago

Selected Answer: A

2 regions apply too

upvoted 1 times

  **helpme1** 7 months, 2 weeks ago

Answer: Yes

Deploying virtual machines to two or more regions can help to ensure the availability of the services running on the virtual machines if a single data center fails. By deploying virtual machines to multiple regions, you can help to ensure that your services are available even if an entire region experiences a failure. In the event of a failure, the virtual machines in the unaffected regions can continue to run and provide the necessary services.

upvoted 5 times

  **Luansi** 8 months, 2 weeks ago

Selected Answer: A

Yes, deploying the virtual machines to two or more regions can help ensure the availability of the services running on them in the event of a single data center failure. By deploying the virtual machines in multiple regions, you can create a distributed environment that is less susceptible to downtime caused by local infrastructure issues. However, you should also consider other factors such as networking, security, and compliance to ensure that your solution meets your availability, performance, and other requirements.

Question #156

Topic 1

HOTSPOT -

Select the answer that correctly completes the sentence.

Hot Area:

An Azure container instance is an example of an Azure

compute service.
identity service.
networking service.
storage service.

Correct Answer:

An Azure container instance is an example of an Azure

compute service.
identity service.
networking service.
storage service.

The term compute refers to the hosting model for the computing resources that your application runs on. For Azure this include:

Azure Container Instances. The fastest and simplest way to run a container in Azure, without having to provision any virtual machines and without having to adopt a higher-level service.

Note, and also the following:

Azure App Service. A managed service for hosting web apps, mobile app back ends, RESTful APIs, or automated business processes.

Azure Spring Cloud. A managed service designed and optimized for hosting Spring Boot apps.

Azure Kubernetes Service (AKS). A managed Kubernetes service for running containerized applications.

Azure Batch. A managed service for running large-scale parallel and high-performance computing (HPC) applications

Azure Functions. A managed FaaS service.

Azure Service Fabric. A distributed systems platform that can run in many environments, including Azure or on premises.

Azure Virtual machines. Deploy and manage VMs inside an Azure virtual network.

Azure Container Apps. Deploy and manage VMs inside an Azure virtual network.

 **Stasheck** Highly Voted 12 months ago

It's A, Computing. No other choice makes sense.

upvoted 9 times

 **Nknow3** Highly Voted 5 months, 2 weeks ago

I thought it was storage since the container's job is to store customers' data.

after looking it up it states that containers can be used to store data within a container image or container volume, the primary purpose of containers is to provide a standardized way to package and deploy applications. Therefore, Azure Container Instances and Azure Kubernetes Service have computed services rather than storage services.

upvoted 5 times

 **zimzimzimma** 3 months, 3 weeks ago

Indeed, containers are primarily used to deploy and run applications. They can be used for storage as well, but Azure offers other solutions more tailored for that purpose.

Question #157

Topic 1

At which OSI layer does ExpressRoute operate?

- A. Layer 2
- B. Layer 3
- C. Layer 5
- D. Layer 7

Correct Answer: A

ExpressRoute circuit. A layer 2 or layer 3 circuit supplied by the connectivity provider that joins the on-premises network with Azure through the edge routers. The circuit uses the hardware infrastructure managed by the connectivity provider.

In OSI terms, you start from layer 2. The "Network Service Provider" concept was a managed concept, where you got a layer 3 solution (in OSI terms). The telecom provider took care of all the complexity for you.

- Vijayshankar001

Highly Voted

11 months, 2 weeks ago

Selected Answer: B

Layer 3

<https://learn.microsoft.com/en-us/azure/expressroute/expressroute-introduction#key-benefits>

Layer 3 connectivity between your on-premises network and the Microsoft Cloud through a connectivity provider. Connectivity can be from an any-to-any (IPVPN) network, a point-to-point Ethernet connection, or through a virtual cross-connection via an Ethernet exchange.

upvoted 25 times
- mlop3s

5 months, 3 weeks ago

Both are right. 2 and 3. MS writes: If you're using a layer 3 connection, the provider should configure and manage routing for you. You provide the information necessary to enable the provider to implement the appropriate routes. <https://learn.microsoft.com/en-us/azure/expressroute/expressroute-introduction> It depends on your provider. You can get a layer 2 or 3.

upvoted 3 times
- mlop3s

5 months, 3 weeks ago

I would go for 3.

upvoted 2 times
- Desolater

Most Recent

2 days, 8 hours ago

The given answer A is correct!

Azure ExpressRoute operates at the OSI (Open Systems Interconnection) model's physical layer (Layer 1) and data link layer (Layer 2). It provides dedicated, private network connections between on-premises datacenters and Azure cloud services. These connections are used to extend an organization's network into Azure, offering private and dedicated network access to Azure resources, such as virtual networks and virtual machines.

ExpressRoute connections are established using dedicated physical connections, such as fiber-optic cables, and connect directly to Microsoft's

network infrastructure. These connections are private and do not traverse the public internet, which enhances security and reliability.

At Layer 2, ExpressRoute uses Ethernet technology to establish the link between your on-premises network and Azure, allowing your network traffic to flow seamlessly between the two environments.

upvoted 1 times

  **Suriman** 5 days, 19 hours ago

Selected Answer: B

The question is "At which OSI layer does ExpressRoute operate?". The following documentation is specifically about ExpressRoute and states categorically that ExpressRoute operates at layer 3. In the "Security" topic, there is the following statement at the beginning of the third paragraph: "ExpressRoute operates in layer 3". See: <https://learn.microsoft.com/en-us/azure/architecture/reference-architectures/hybrid-networking/expressroute>

Therefore, the "correct" answer is WRONG as stated in the documentation about ExpressRoute. They should not mark an incorrect answer as correct. This is unfair to those trying to obtain the certification.

upvoted 1 times

  **DJP_007** 2 weeks, 2 days ago

Layer 3

upvoted 1 times

  **Rainheart** 1 month ago

Layer 3

upvoted 1 times

  **mhpmyt7** 2 months, 2 weeks ago

The Keyword here is OSI.

With OSI Model, you have 7 Layers and the Layer 3 is the network Layer. It cannot be Layer 2 of the OSI model since that would be the DataLink Layer.

Layer 2 would only be correct if the question mentions the TCP/IP Layer as that would be the Network Layer.

But in this instance, the correct answer would be Layer 3, since the question specifically refers to the OSI MODEL.

Question #159

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
Azure resources can only access other resources in the same resource group.	☐	☐
If you delete a resource group, all the resources in the resource group will be deleted.	☐	☐
A resource group can contain resources from multiple Azure regions.	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
Azure resources can only access other resources in the same resource group.	☐	☒
If you delete a resource group, all the resources in the resource group will be deleted.	☒	☐
A resource group can contain resources from multiple Azure regions.	☒	☐

Box 1: No -

A resource can interact with resources in other resource groups.

Box 2: Yes -

Deleting the resource group will remove the resource group as well as all the resources in that resource group. This can be useful for the management of resources. For example, a virtual machine has several components (the VM itself, virtual disks, network adapter etc.). By placing the VM in its own resource group, you can delete the VM along with all its associated components by deleting the resource group. Another example is when creating a test environment. You could place the entire test environment (Network components, virtual machines etc.) in one resource group. You can then delete the entire test environment by deleting the resource group.

Box 3: Yes -

Resources from multiple different regions can be placed in a resource group. The resource group only contains metadata about the resources it contains.

References:

Last question's link doesn't work, you can find documentation here
<https://docs.microsoft.com/en-us/azure/cloud-adoption-framework/decision-guides/regions/>

"Azure resource groups are regional specific constructs. It is normal, however, for resources within a resource group to span multiple regions. When doing so, it is important to consider that in the event of a regional failure, control plane operations against a resource group will fail in the affected region, even though the resources in other regions (within that resource group) will continue to operate. This can affect both your network design and your resource group design."
upvoted 22 times
- Frns

Most Recent

3 months ago

No: A resource can connect to resources in other resource groups. This scenario is common when the two resources are related but don't share the same lifecycle. For example, you can have a web app that connects to a database in a different resource group.

Yes: When you delete a resource group, all resources in the resource group are also deleted.

Yes: The resources in a resource group can be located in different regions than the resource group.
When you create a resource group, you need to provide a location for that resource group.

Question #160

Topic 1

You plan to store 20 TB of data in Azure. The data will be accessed infrequently and visualized by using Microsoft Power BI. You need to recommend a storage solution for the data. Which two solutions should you recommend? Each correct answer presents a complete solution. NOTE: Each correct selection is worth one point.

- A. Azure Data Lake
- B. Azure Cosmos DB
- C. Azure SQL Data Warehouse
- D. Azure SQL Database
- E. Azure Database for PostgreSQL

Correct Answer: AC

You can use Power BI to analyze and visualize data stored in Azure Data Lake and Azure SQL Data Warehouse. Azure Data Lake includes all of the capabilities required to make it easy for developers, data scientists and analysts to store data of any size and shape and at any speed, and do all types of processing and analytics across platforms and languages. It removes the complexities of ingesting and storing all your data while making it faster to get up and running with batch, streaming and interactive analytics. It also integrates seamlessly with operational stores and data warehouses so that you can extend current data applications.

Question #164

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

An Azure administrator plans to run a PowerShell script that creates Azure resources.

You need to recommend which computer configuration to use to run the script.

Solution: Run the script from a computer that runs Linux and has the Azure CLI tools installed.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: B

A PowerShell script is a file that contains PowerShell cmdlets and code. A PowerShell script needs to be run in PowerShell. PowerShell can now be installed on Linux. However, the question states that the computer has Azure CLI tools, not PowerShell installed. Therefore, this solution does not meet the goal.

Question #165

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

An Azure administrator plans to run a PowerShell script that creates Azure resources.

You need to recommend which computer configuration to use to run the script.

Solution: Run the script from a computer that runs Chrome OS and uses Azure Cloud Shell.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: A

A PowerShell script is a file that contains PowerShell cmdlets and code. A PowerShell script needs to be run in PowerShell.

With the Azure Cloud Shell, you can run PowerShell cmdlets and scripts in a Web browser. You log in to the Azure Portal and select the Azure Cloud Shell option.

This will open a PowerShell session in the Web browser. The Azure Cloud Shell has the necessary Azure PowerShell module installed.

Note: to run a PowerShell script in the Azure Cloud Shell, you need to change to the directory where the PowerShell script is stored.

So after reading all your comments, the conclusion is that the answer is either YES or NO :(
upvoted 3 times

🗨️ 👤 **Harry28731** 1 year, 9 months ago

Yes, you need to understand the question logic. It's too prove that even though you can't have azure CLI or powershell on Chrome OS computers, you can still do your job (by using Cloud Shell which is available from Azure Portal through the web browser). Any other comment is just misleading because they are picky.
upvoted 1 times

🗨️ 👤 **AbbeyJ** 1 year, 10 months ago

The correct answer is YES. You can open azure portal from any OS browser, therefore you can Run the script from a computer that runs ChromeOS and use Azure Cloud Shell.
upvoted 1 times

🗨️ 👤 **mikamozg** 1 year, 10 months ago

i think Microsoft wants us to understand and accept one particular thing. It doesn't matter what OS you have , but if you have browser based cli or powershell you will be able to achieve it. ignore OS. azure cloud shell by itself means that browser will be used. concentrate on azure cloud shell. for me it is YES
upvoted 1 times

🗨️ 👤 **Imran_Md** 1 year, 11 months ago

I think the answer is YES because Chrome OS is a Gentoo Linux-based operating system designed by Google. It is derived from the free software Chromium OS and uses the Google Chrome web browser as its principal user interface so through the WEB browser we can get access to the Azure Portal and perform our tasks.
upvoted 1 times

Question #166

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
From Azure Service Health, an administrator can view the health of all the services in an Azure environment.	☐	☐
From Azure Service Health, an administrator can create a rule to be alerted if an Azure service fails.	☐	☐
From Azure Service Health, an administrator can prevent a service failure	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
From Azure Service Health, an administrator can view the health of all the services in an Azure environment.	☒	☐
From Azure Service Health, an administrator can create a rule to be alerted if an Azure service fails.	☒	☐
From Azure Service Health, an administrator can prevent a service failure	☐	☒

Box 1: Yes -

Azure Service Health consists of three components: Azure Status, Azure Service Heath and Azure Resource Health.

Azure service health provides a personalized view of the health of the Azure services and regions you're using. This is the best place to look for service impacting communications about outages, planned maintenance activities, and other health advisories because the authenticated Azure Service Health experience knows which services and resources you currently use.

To view the health of all other services available in Azure, you would use the Azure Status component of Azure Service Health. Azure status informs you of service outages in Azure on the Azure Status page. The page is a global view of the health of all Azure services across all Azure regions.

Box 2: Yes -

The best way to use Service Health is to set up Service Health alerts to notify you via your preferred communication channels when service issues, planned maintenance, or other changes may affect the Azure services and regions you use.

Box 3: No -

You can use Resource Health to view the health of a virtual machine. However, you cannot use Resource Health to prevent a service failure affecting the virtual machine.

Azure resource health provides information about the health of your individual cloud resources such as a specific virtual machine instance.

Given Answer is correct.

upvoted 43 times
- SilkyS19

Highly Voted

 2 years, 4 months ago

First one is tricky - The word Azure makes the big difference here.
- Ideally Azure status informs you of service outages in Azure on the Azure Status page. The page is a global view of the health of all Azure services across all Azure regions. As, the Azure Status is part of the Azure Service Health this can answer is YES.

However, if question mentioned just 'Service Health' then it would be wrong as Service Health the provides a personalized view of the health of the Azure services and regions you're using.

Azure Service Health => Azure Status + Service Health + Resource health

Question #167

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

An Azure administrator plans to run a PowerShell script that creates Azure resources.

You need to recommend which computer configuration to use to run the script.

Solution: Run the script from a computer that runs macOS and has PowerShell Core 6.0 installed.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: A

A PowerShell script is a file that contains PowerShell cmdlets and code. A PowerShell script needs to be run in PowerShell.

In this question, the computer has PowerShell Core 6.0 installed. Therefore, this solution does meet the goal.

Note: To create Azure resources using PowerShell, you would need to import the Azure PowerShell module which includes the PowerShell cmdlets required to create the resources.

- HakimNY**

8 months, 2 weeks ago

The question is about running Powershell commands, if you install on a Mac PowerShell Core 6.0 then you will be able to run command such as : New-AzVm, with Azure CLI the command should be : az vm create, so the answer is A

upvoted 6 times
- orlandoryo**

6 months, 2 weeks ago

You still need the Azure module; otherwise, you CANNOT run the Azure commands successfully.

<https://devblogs.microsoft.com/powershell/powershell-core-6-0-generally-available-ga-and-supported/>

upvoted 2 times

  **S_06** 11 months ago

Even your answer doesn't provides clarity or correctness. The correct answer is YES, because we need just PowerShell Core 6.0 to run the PowerShell commands and it runs on MacOS.
The AzureCLI has nothing to do in the scenario. Stop giving wrong answers with confidence.

upvoted 36 times

  **AULABI22** 8 months, 2 weeks ago

To run PowerShell scripts you only need PowerShell Core 6.0 installed, BUT the question also requests to create Azure resources. In order to accomplish that, you need the Azure PowerShell module which does not come with PowerShell Core 6.0. In fact, you must install it apart using the Install-Module cmdlet:
<https://learn.microsoft.com/en-us/powershell/azure/install-az-ps?view=azps-9.2.0#installation>

So, the correct answer is NO, as you cannot create Azure resources without the Azure PowerShell module.

upvoted 6 times

  **NABIL10** 9 months ago

you deserve all the respect, totally agree with you !
The answer is given in Question #187 please check

upvoted 3 times

  **Nujjy**  3 years, 4 months ago

These questions are poorly worded. You should still need to install the Az module inside powershell core for this to run.

upvoted 27 times

  **shehanks**  3 weeks, 6 days ago

PowerShell 7.0 or higher require macOS 10.13 and higher

<https://learn.microsoft.com/en-us/powershell/scripting/install/installing-powershell-on-macos?view=powershell-7.3>

upvoted 1 times

  **zimzimzimma** 1 month, 2 weeks ago

Typical MS semantics. I'd say the answer it YES, because it says:
"Solution: Run the script from a computer that runs macOS and has PowerShell Core 6.0 installed."
The answer would be NO if the question stated:
"Solution: Run the script from a computer that runs macOS and has ONLY PowerShell Core 6.0 installed."

No powershell version 6.2.4+ allow any os to accomplish this task

upvoted 1 times

  **Londoner** 2 months, 1 week ago

you need powershell on macos (you can then install the azure module using the powershell command)
my answer A
Source: <https://techgenix.com/powershell-in-macos/>

upvoted 1 times

  **JPL4U** 2 months, 2 weeks ago

No, running the script from a computer that runs macOS and has PowerShell Core 6.0 installed would not be suitable for creating Azure resources.

Azure resources are typically managed and provisioned using Azure PowerShell modules, which are designed to be used with Windows PowerShell. Although PowerShell Core is cross-platform and can run on macOS, it doesn't provide the same level of compatibility and support for Azure modules as Windows PowerShell does.

To meet the goal of creating Azure resources, it is recommended to use a computer running Windows operating system with Windows PowerShell installed. Windows PowerShell is the preferred choice for managing Azure resources and provides full support for Azure modules and cmdlets.

To run Azure PowerShell command in Mac, you can follow these steps123:
Install PowerShell Core by running the following command: dotnet tool install --global PowerShell
Install the Az module.
Open a terminal or Visual Studio Code and type the following: pwsh. This will launch a PowerShell Core session.
Log in to your Azure tenant using the az login command.
If necessary, select a default subscription using the az account set command.
Use the az vm run-command invoke and specify the --resource-group and --name of the virtual machine. Use the --command-id of RunPowerShellScript, and specify the script file name using an At (@) sign.

upvoted 1 times

  **1sourabhpatel1** 3 months, 2 weeks ago

NO

The solution does not meet the goal because the PowerShell Core 6.0 version mentioned in the solution is not compatible with Azure. Azure requires the use of Azure PowerShell, which is a specific module designed for managing Azure resources. PowerShell Core 6.0 may not have the necessary Azure-specific cmdlets and functionality to create Azure resources. Therefore, it is recommended to use a Windows computer with the latest version of Windows PowerShell or Azure PowerShell installed to run the script.

upvoted 2 times

  **zimzimzimme** 3 months, 3 weeks ago

Why are more and more people viewing chatGPT as the 'official source' and not Microsoft itself? It baffles me, and it's not good.

upvoted 1 times

  **javito82** 3 months, 4 weeks ago

ChatGPT 4.0 says Yes:
"Yes, run the script from a computer running macOS and having PowerShell Core 6.0 installed. It may be a suitable solution to run a PowerShell script that creates Azure resources.

PowerShell Core is a cross-platform version of PowerShell that runs on Windows, macOS, and various Linux distributions. By using PowerShell Core on macOS, you'll have the ability to run Azure-compatible PowerShell commands and scripts.

It is important to note that the specific version of PowerShell Core mentioned in the solution (PowerShell Core 6.0) may be out of date. Instead, it would be recommended to use the latest version of PowerShell Core that is currently supported by Azure.

It's always important to check the official Azure documentation and up-to-date sources for information about the PowerShell Core versions supported by Azure at the time the script will be executed."

Selected Answer: A

You can run Azure Cloud Shell from the Azure Portal within the browser. This allows using PowerShell without needing to install it. Quote: "Try it out in your browser with Azure Cloud Shell, or install on your local machine" from: <https://azure.microsoft.com/en-us/get-started/azure-portal/cloud-shell/#features>

upvoted 1 times

  **semauni** 4 months ago

Correction: <https://learn.microsoft.com/en-us/powershell/azure/get-started-azureps?view=azps-9.7.1&viewFallbackFrom=azurermps-6.8.1> . I wish I could edit comments ;)

chatgpt says B

upvoted 1 times

  **Hoeishetmogelijk** 4 months, 1 week ago

Selected Answer: B

A is wrong. The red flag is "PowerShell Core 6.0" because PowerShell version 7 or higher is required:
<https://learn.microsoft.com/en-us/powershell/azure/install-azps-macos?view=azps-9.7.1>

upvoted 2 times

  **pschanne** 4 months, 4 weeks ago

Basic need - Azure PS module

upvoted 1 times

  **speedyweedy** 4 months, 4 weeks ago

Selected Answer: B

as per chatGPT

No, the Azure PowerShell module is not installed by default when installing PowerShell Core 6.0 on macOS. You need to install the module separately using the PowerShellGet module.

Here's the command to install the Azure PowerShell module on macOS using PowerShell Core 6.0:

```
```powershell
Install-Module -Name Az -AllowClobber -Scope CurrentUser
```
```

This command will install the latest version of the Azure PowerShell module for the current user, and will overwrite any existing version of the module if the `-AllowClobber`` parameter is used.

Once the Azure PowerShell module is installed, you can import it into your PowerShell session using the ``Import-Module Az`` command. You can then use the Azure PowerShell cmdlets to manage your Azure resources.

Selected Answer: A

with PSC installed you can install the PS module then run script to create resouces

upvoted 2 times

HOTSPOT -

You need to view a list of planned maintenance events that can affect the availability of an Azure subscription.

Which blade should you use from the Azure portal? To answer, select the appropriate blade in the answer area.

Hot Area:

Correct Answer:

On the Help and Support blade, there is a Service Health option. If you click Service Health, a new blade opens. The Service Health blade contains the Planned Maintenance link which opens a blade where you can view a list of planned maintenance events that can affect the availability of an Azure subscription.

  **Su_L** Highly Voted 2 years, 7 months ago
the image is cut-off at bottom, at the end on this Menu list you will see 'Help + Support' listed as a Menu option that's the correct answer
upvoted 319 times

  **zimzimzima** 3 months, 3 weeks ago
Don't think the image is cut off, if you choose 'Dashboard' you will be presented with a 'Service Health' option in the dashboard. I see it in my subscription and I didn't put it there. It's there by default next to 'Marketplace'.
Correct answer should be Dashboard.
upvoted 2 times

Question #169

Topic 1

DRAG DROP -

Match the Azure service to the correct definition.

Instructions: To answer, drag the appropriate Azure service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.

NOTE: Each correct match is worth one point.

Select and Place:

Answer Options

Answer Area

Azure Advisor		An integrated solution for the deployment of code
Azure Cognitive Services		A tool that provides guidance and recommendations to improve an Azure environment
Azure Application Insights		A simplified tool to build intelligent Artificial Intelligence (AI) applications
Azure DevOps		Monitors web applications

Correct Answer:

Answer Options

Answer Area

Azure Advisor	Azure DevOps	An integrated solution for the deployment of code
Azure Cognitive Services	Azure Advisor	A tool that provides guidance and recommendations to improve an Azure environment
Azure Application Insights	Azure Cognitive Services	A simplified tool to build intelligent Artificial Intelligence (AI) applications
Azure DevOps	Azure Application Insights	Monitors web applications

Box 1: Azure DevOps.

Azure DevOps is Microsoft's primary software development and deployment platform.

DevOps influences the application lifecycle throughout its plan, develop, deliver and operate phases.

Box 2: Azure Advisor.

Advisor is a personalized cloud consultant that helps you follow best practices to optimize your Azure deployments. It analyzes your resource configuration and usage telemetry and then recommends solutions that can help you improve the cost effectiveness, performance, high availability, and security of your Azure resources.

Box 3: Azure Cognitive Services.

Azure Cognitive Services are APIs, SDKs, and services available to help developers build intelligent applications without having direct AI or data science skills or knowledge. Azure Cognitive Services enable developers to easily add cognitive features into their applications. The goal of Azure Cognitive Services is to help developers create applications that can see, hear, speak, understand, and even begin to reason. The catalog of services within Azure Cognitive Services can be categorized into five main pillars - Vision, Speech, Language, Web Search, and Decision.

Box 4: Azure Application Insights.

Azure Application Insights detects and diagnoses anomalies in web apps.

Application Insights, a feature of Azure Monitor, is an extensible Application Performance Management (APM) service for developers and DevOps professionals.

Use it to monitor your live applications. It will automatically detect performance anomalies, and includes powerful analytics tools to help you diagnose issues and to understand what users actually do with your app.

References:

<https://docs.microsoft.com/en-us/azure/azure-monitor/app/app-insights-overview> <https://azure.microsoft.com/en-gb/overview/what-is-devops/> <https://docs.microsoft.com/en-us/azure/advisor/advisor-overview> <https://docs.microsoft.com/en-us/azure/cognitive-services/welcome>

Question #170

Topic 1

DRAG DROP -

Match the Azure service to the correct description.

Instructions: To answer, drag the appropriate Azure service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.

NOTE: Each correct match is worth one point.

Select and Place:

Answer Options	Answer Area
Azure HDInsight	A managed relational cloud database service.
Azure Data Lake Analytics	A cloud-based service that leverages massively parallel processing (MPP) to quickly run complex queries across petabytes of data in a relational database.
Azure SQL Synapse Analytics	Can run massively parallel data transformation and processing programs across petabytes of data
Azure SQL Database	An open-source framework for the distributed processing and analysis of big data sets in clusters

Correct Answer:

Answer Options	Answer Area
	Azure SQL Database A managed relational cloud database service.
	Azure SQL Synapse Analytics A cloud-based service that leverages massively parallel processing (MPP) to quickly run complex queries across petabytes of data in a relational database.
	Azure Data Lake Analytics Can run massively parallel data transformation and processing programs across petabytes of data
	Azure HDInsight An open-source framework for the distributed processing and analysis of big data sets in clusters

Box 1: Azure SQL Database -
SQL Server is a relational database service. Azure SQL Database is a managed SQL Server Database in Azure. The SQL Server is managed by Microsoft; you just have access to the database.

Box 2: Azure SQL Synapse Analytics
Azure SQL Synapse Analytics (previously called Data Warehouse) is a cloud-based Platform-as-a-Service (PaaS) offering from Microsoft. It is a large-scale, distributed, MPP (massively parallel processing) relational database technology in the same class of competitors as Amazon Redshift or Snowflake. Azure SQL Synapse Analytics is an important component of the Modern Data Warehouse multi-platform architecture. Because Azure SQL Synapse Analytics is an MPP system with a shared-nothing architecture across distributions, it is meant for large-scale analytical workloads which can take advantage of parallelism.

Box 3: Azure Data Lake Analytics
You can process big data jobs in seconds with Azure Data Lake Analytics. You can process petabytes of data for diverse workload categories such as querying, ETL, analytics, machine learning, machine translation, image processing and sentiment analysis by leveraging existing libraries written in .NET languages, R or Python.

Box 4: Azure HDInsight.
Apache Hadoop was the original open-source framework for distributed processing and analysis of big data sets on clusters. The Hadoop ecosystem includes related software and utilities, including Apache Hive, Apache HBase, Spark, Kafka, and many others. Azure HDInsight is a fully managed, full-spectrum, open-source analytics service in the cloud for enterprises. The Apache Hadoop cluster type in Azure HDInsight allows you to use HDFS, YARN resource management, and a simple MapReduce programming model to process and analyze batch data in parallel.

Question #171

Topic 1

HOTSPOT -

You need to identify which blades in the Azure portal must be used to perform the following tasks:

- ☞ View security recommendations.
- ☞ Monitor the health of Azure services.
- ☞ Browse available virtual machine images.

Which blade should you identify for each task? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Monitor the health of Azure services:

	▼
Monitor	
Subscriptions	
Marketplace	
Advisor	

Browse available virtual machine images:

	▼
Monitor	
Subscriptions	
Marketplace	
Advisor	

View security recommendations:

	▼
Monitor	
Subscriptions	
Marketplace	
Advisor	

Correct Answer:

Answer Area

Monitor the health of Azure services:

	▼
Monitor	
Subscriptions	
Marketplace	
Advisor	

Browse available virtual machine images:

	▼
Monitor	
Subscriptions	
Marketplace	
Advisor	

View security recommendations:

	▼
Monitor	
Subscriptions	
Marketplace	
Advisor	

Box 1:

Azure Monitor is used to monitor the health of Azure services.

Azure Monitor maximizes the availability and performance of your applications and services by delivering a comprehensive solution for collecting, analyzing, and acting on telemetry from your cloud and on-premises environments. It helps you understand how your applications are

performing and proactively identifies issues affecting them and the resources they depend on.

Box 2:

You can browse available virtual machine images in the Azure Marketplace.

Azure Marketplace provides access and information on solutions and services available from Microsoft and their partners. Customers can discover, try, or buy cloud software solutions built on or for Azure. The catalog of 8,000+ listings provides Azure building blocks, such as Virtual Machines (VMs), APIs, Azure apps, Solution Templates and managed applications, SaaS apps, containers, and consulting services.

Box 3.

Azure Advisor displays security recommendations.

Azure Advisor provides you with a consistent, consolidated view of recommendations for all your Azure resources. It integrates with Azure Security Center to bring you security recommendations. You can get security recommendations from the Security tab on the Advisor dashboard. Security Center helps you prevent, detect, and respond to threats with increased visibility into and control over the security of your Azure resources. It periodically analyzes the security state of your Azure resources. When Security Center identifies potential security vulnerabilities, it creates recommendations. The recommendations guide you through the process of configuring the controls you need.

Question #172

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You have an Azure environment. You need to create a new Azure virtual machine from a tablet that runs the Android operating system.

Solution: You use Bash in Azure Cloud Shell.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: A

With Azure Cloud Shell, you can create virtual machines using Bash or PowerShell.

Azure Cloud Shell is an interactive, authenticated, browser-accessible shell for managing Azure resources. It provides the flexibility of choosing the shell experience that best suits the way you work, either Bash or PowerShell.

Question #173

Topic 1

You have an on-premises application that sends email notifications automatically based on a rule.

You plan to migrate the application to Azure.

You need to recommend a serverless computing solution for the application.

What should you include in the recommendation?

- A. a web app
- B. a server image in Azure Marketplace
- C. a logic app
- D. an API app

Correct Answer: C

Azure Logic Apps is a cloud service that helps you schedule, automate, and orchestrate tasks, business processes, and workflows when you need to integrate apps, data, systems, and services across enterprises or organizations. Logic Apps simplifies how you design and build scalable solutions for app integration, data integration, system integration, enterprise application integration (EAI), and business-to-business (B2B) communication, whether in the cloud, on premises, or both.

For example, here are just a few workloads you can automate with logic apps:

- ☞ Process and route orders across on-premises systems and cloud services.
- ☞ Send email notifications with Office 365 when events happen in various systems, apps, and services.
- ☞ Move uploaded files from an SFTP or FTP server to Azure Storage.
- ☞ Monitor tweets for a specific subject, analyze the sentiment, and create alerts or tasks for items that need review.

haha logic app is the only one I didn't know anything about, but seeing the 3 options I knew none of them are suitable for this. So I ended guessing this right :)

B - it's a server, you need a serverless solution
D - API, no! you need to migrate the whole app
A - web app, no, NO because web requires a server. The web is nothing but a huge WAN composed of many, many LANs.
C - Whereas logic apps at least tells no conflicting information and implies you can migrate the whole app to it. Also the word "logic" refers to the email app sending emails "based on one rule". So I imagine it is done automatically, or 'logically'. Hence they are requiring a ServerLESS solution!

Question #174

Topic 1

You plan to deploy a website to Azure. The website will be accessed by users worldwide and will host large video files. You need to recommend which Azure feature must be used to provide the best video playback experience. What should you recommend?

- A. an application gateway
- B. an Azure ExpressRoute circuit
- C. a content delivery network (CDN)
- D. an Azure Traffic Manager profile

Correct Answer: C

The question states that users are located worldwide and will be downloading large video files. The video playback experience would be improved if they can download the video from servers in the same region as the users. We can achieve this by using a content deliver network. A content delivery network (CDN) is a distributed network of servers that can efficiently deliver web content to users. CDNs store cached content on edge servers in point-of-presence (POP) locations that are close to end users, to minimize latency. Azure Content Delivery Network (CDN) offers developers a global solution for rapidly delivering high-bandwidth content to users by caching their content at strategically placed physical nodes across the world. Azure CDN can also accelerate dynamic content, which cannot be cached, by leveraging various network optimizations using CDN POPs. For example, route optimization to bypass Border Gateway Protocol (BGP). The benefits of using Azure CDN to deliver web site assets include:

☞ Better performance and improved user experience for end users, especially when using applications in which multiple round-trips are required to load content.

☞ Large scaling to better handle instantaneous high loads, such as the start of a product launch event.

☞ Distribution of user requests and serving of content directly from edge servers so that less traffic is sent to the origin server.

  **Pinha** 8 months, 3 weeks ago

C

A content delivery network (CDN) is a global network of servers that are designed to deliver content, such as web pages, images, and videos, more efficiently to users. CDNs work by caching content at locations around the world and serving it from the location that is closest to the user. This can significantly improve the performance and speed of delivering content to users, especially for large video files.

Question #175

Topic 1

Your company plans to deploy several million sensors that will upload data to Azure.

You need to identify which Azure resources must be created to support the planned solution.

Which two Azure resources should you identify? Each correct answer presents part of the solution.

NOTE: Each correct selection is worth one point.

- A. Azure Data Lake
- B. Azure Queue storage
- C. Azure File Storage
- D. Azure IoT Hub
- E. Azure Notification Hubs

Correct Answer: AD

IoT Hub (Internet of things Hub) provides data from millions of sensors.

IoT Hub is a managed service, hosted in the cloud, that acts as a central message hub for bi-directional communication between your IoT application and the devices it manages. You can use Azure IoT Hub to build IoT solutions with reliable and secure communications between millions of IoT devices and a cloud- hosted solution backend. You can connect virtually any device to IoT Hub.

There are two storage services IoT Hub can route messages to – Azure Blob Storage and Azure Data Lake Storage Gen2 (ADLS Gen2) accounts.

Azure Data Lake Storage accounts are hierarchical namespace-enabled storage accounts built on top of blob storage. Both of these use blobs for their storage.

References:

<https://docs.microsoft.com/en-us/azure/iot-hub/about-iot-hub>

<https://docs.microsoft.com/en-us/azure/iot-hub/iot-hub-devguide-messages-d2c>

-   **Moon**

Highly Voted

 3 years, 10 months ago

I would go with "A & D".
Data Lake: is typical storage for IoT Hub as in the below link
<https://docs.microsoft.com/en-us/azure/iot-hub/iot-hub-devguide-messages-d2c>
upvoted 165 times
-   **sbettani** 3 years, 10 months ago

In my opinion Queue is correct,
"Azure Queue Storage is a service for storing large numbers of messages. You access messages from anywhere in the world via authenticated calls using HTTP or HTTPS. A queue message can be up to 64 KB in size. A queue may contain millions of messages, up to the total capacity limit of a storage account. Queues are commonly used to create a backlog of work to process asynchronously."

source "<https://docs.microsoft.com/en-us/azure/storage/queues/storage-queues-introduction>"
upvoted 36 times
-   **ExaminatorAZ** 3 years, 4 months ago

"The sensors will upload DATA" it doesn't says messages or logs.
upvoted 15 times
-   **karmaDude** 3 years, 4 months ago

Queues are best suited for fail-safe transactional data log keeping. Lets say you are an E-Commerce company, for some reason, your SQL database isn't available in such situation you have a fail-safe mechanism to transfer transactional data to Azure Queues , which allows transactions to be saved and resumed for operational use when SQL storage is available.
upvoted 7 times
-   **ConaxLearn** 3 years, 1 month ago

Queues are for sequential processing of messegas (requests) and doesn't store data for long. Once a request is processed it is then removed from the queue. The data uploaded by the sensors don't need to be processed immediately and should be stored for a good period of time to allow it to be analysed later. Hence Data Lake is more appropriate answer. Even if you implement a queue, the data will still end up in Data Lake or other kind of databases.
upvoted 9 times
-   **MjMumbai** 3 years, 3 months ago

Datalake is used to process large amount of data and perform analytics on top of that. It is not used by transaction purpose. Once you get IoT data in queue, you can push it to datalake for further analysis purpose. so queue is right answer.

Thats true. A & D are correct.
According to Microsoft, Azure Data Lake store is a hyper-scale repository for big data analytics workloads and a Hadoop Distributed File System (HDFS) for the cloud. It... Imposes no fixed limits on file siz
upvoted 2 times

  **Ayoubbts** Highly Voted 3 years, 9 months ago
B and D are correct. In the statement we can read : « deploy several million sensors that will upload data to Azure ». Here the keyword is deploy. To deploy IoT solutions you have to use Azure IoT Hub. The Data Lake is for analytics not deployment. You will obviously use the Queue Storage to handle the amount of exchanges.

Question #176

Topic 1

You have an Azure web app.

You need to manage the settings of the web app from an iPhone.

What are two Azure management tools that you can use? Each correct answer presents a complete solution.

NOTE: Each correct selection is worth one point.

- A. Azure CLI
- B. the Azure portal
- C. Azure Cloud Shell
- D. Windows PowerShell
- E. Azure Storage Explorer

Correct Answer: BC

The Azure portal is the web-based portal for managing Azure. Being web-based, you can use the Azure portal on an iPhone.

Azure Cloud Shell is a web-based command line for managing Azure. You access the Azure Cloud Shell from the Azure portal. Being web-based, you can use the Azure Cloud Shell on an iPhone.

Incorrect Answers:

A: Azure CLI can be installed on MacOS but it cannot be installed on an iPhone.

D: Windows PowerShell can be installed on MacOS but it cannot be installed on an iPhone.

E: Azure Storage Explorer is not used to manage Azure web apps.

I must have missed something in this question...

You can manage web app settings from the Azure portal itself and with Azure Cloud Shell (integrated in the portal).

Azure CLI depends on Cloud Shell, that depends on the Azure Portal.

Azure portal must be one of the correct answers

upvoted 81 times

  **MorZee** 3 years, 8 months ago

You can use the cloudshell without the portal: shell.azure.com

upvoted 19 times

  **Rooks** 3 years, 5 months ago

From MS site <https://azure.microsoft.com/en-us/features/azure-portal/mobile-app/#features> it says:

Run commands to manage your Azure resources

Want to use the command line? Run ad hoc Azure CLI or PowerShell commands from the Azure mobile app.

So the Answer is apparently right.

upvoted 6 times

  **qqqqqq123456** 3 years, 4 months ago

<https://www.examttopics.com/exams/microsoft/az-900/custom-view/>

428/595

If so then in the options it should be "Azure mobile app" not "Azure CLI". Because you can't just run CLI without installing any extra app on iPhone. But you can browse internet with default browser Safari and visit Azure Portal. So in given wording, the correct answers are Azure Portal and Azure Cloud Shell.

upvoted 34 times

  **JeanTremblay** 2 years, 11 months ago

Yes, "Azure mobile app" not "Azure CLI"
or, Azure CLI running in the "Azure mobile app" for iPhone assuming a prior installation

upvoted 3 times

  **ConaxLearn** 3 years, 1 month ago

The Azure Mobile App contains the Azure Cloud Shell. So the answer is still the Portal and the Cloud Shell.

upvoted 3 times

  **awssecuritynewbie** 3 years, 1 month ago

you cannot use CLI .. azure mobile app is A WHOLE answer it self! it didn't ask to see what is ran under it or anything else... you can really make anything fly you can even root your IPHONE but that is not the answer haha

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
Azure Advisor can generate a list of Azure virtual machines that are protected by Azure Backup.	☐	☐
If you implement the security recommendations provided by Azure Advisor, your company's secure score will decrease.	☐	☐
To maintain Microsoft support, you must implement the security recommendations provided by Azure Advisor within a period of 30 days.	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
Azure Advisor can generate a list of Azure virtual machines that are protected by Azure Backup.	☐	☒
If you implement the security recommendations provided by Azure Advisor, your company's secure score will decrease.	☐	☒
To maintain Microsoft support, you must implement the security recommendations provided by Azure Advisor within a period of 30 days.	☐	☒

Box 1: No -

Azure Advisor does not generate a list of virtual machines that ARE protected by Azure Backup. Azure Advisor does however, generate a list of virtual that ARE

NOT protected by Azure Backup. You can view a list of virtual machines that are protected by Azure Backup by viewing the Protected Items in the Azure Recovery Services Vault.

Box 2: No -

If you implement the security recommendations, you company's score will increase, not decrease.

Box 3: No -

There is no requirement to implement the security recommendations provided by Azure Advisor. The recommendations are just that, 'recommendations'. They are not 'requirements'.

 **viktornm** 7 months, 1 week ago

C. Azure Monitor

Azure Monitor can be used to automatically send an alert if an administrator stops an Azure virtual machine. With Azure Monitor, you can set up alerts based on metrics and log data, and you can receive notifications through email, SMS, webhooks, and other channels.

In the case of an Azure virtual machine, you can use Azure Monitor to set up an alert that triggers if the virtual machine goes down or becomes unavailable. This way, you can receive an alert as soon as the virtual machine stops, allowing you to take prompt action and resolve the issue.

Azure Advisor provides recommendations for optimizing your Azure resources. Azure Service Health provides information about the health of Azure services and helps you prepare for, and respond to, Azure service incidents. Azure Network Watcher provides monitoring and diagnostics for your Azure network.

Question #180

Topic 1

DRAG DROP -

Match the Azure services to the correct descriptions.

Instructions: To answer, drag the appropriate Azure service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.

NOTE: Each correct match is worth one point

Select and Place:

Azure Services

Azure Machine Learning

Azure Synapse Analytics

Azure IoT Hub

Azure Functions

Answer Area

Provides a cloud-based Enterprise Data Warehouse (EDW).

Uses past trainings to provide predictions that have high probability.

Provides serverless computing functionalities.

Processes data from millions of sensors.

Correct Answer:

Azure Services

Answer Area

Azure Synapse Analytics

Provides a cloud-based Enterprise Data Warehouse (EDW).

Azure Machine Learning

Uses past trainings to provide predictions that have high probability.

Azure Functions

Provides serverless computing functionalities.

Azure IoT Hub

Processes data from millions of sensors.

Box 1: Azure SQL Synapse Analytics

Azure SQL Synapse Analytics (previously called Data Warehouse) is a cloud-based Platform-as-a-Service (PaaS) offering from Microsoft. It is a large-scale, distributed, MPP (massively parallel processing) relational database technology in the same class of competitors as Amazon Redshift or Snowflake. Azure SQL

Synapse Analytics is an important component of the Modern Data Warehouse multi-platform architecture. Because Azure SQL Synapse Analytics is an MPP system with a shared-nothing architecture across distributions, it is meant for large-scale analytical workloads which can take advantage of parallelism.

Box 2:

Azure Machine Learning uses past trainings to provide predictions that have high probability.

Machine learning is a data science technique that allows computers to use existing data to forecast future behaviors, outcomes, and trends. By using machine learning, computers learn without being explicitly programmed.

Forecasts or predictions from machine learning can make apps and devices smarter. For example, when you shop online, machine learning helps recommend other products you might want based on what you've bought.

Box 3:

Azure Functions provides serverless computing functionalities.

Azure Functions is a serverless compute service that lets you run event-triggered code without having to explicitly provision or manage infrastructure.

Box 4:

IoT Hub (Internet of things Hub) provides data from millions of sensors.

IoT Hub is a managed service, hosted in the cloud, that acts as a central message hub for bi-directional communication between your IoT application and the devices it manages. You can use Azure IoT Hub to build IoT solutions with reliable and secure communications between millions of IoT devices and a cloud-hosted solution backend. You can connect virtually any device to IoT Hub.

Reference:

Question #181

Topic 1

You have an Azure environment.

You need to create a new Azure virtual machine from a tablet that runs the Android operating system.

What are three possible solutions? Each correct answer presents a complete solution.

NOTE: Each correct selection is worth one point.

- A. Use Bash in Azure Cloud Shell.
- B. Use PowerShell in Azure Cloud Shell.
- C. Use the PowerApps portal.
- D. Use the Security & Compliance admin center.
- E. Use the Azure portal.

Correct Answer: ABE

The Android tablet device will have a web browser (Chrome). That's enough to connect to the Azure portal.

The Azure portal offers three ways to create a VM:

 Using the graphical portal.

 Using the Azure Cloud Shell using Bash.

 Using the Azure Cloud Shell using PowerShell.

Like in AWS: Cli and Graphical way is there to connect Ec2(Vm)
Like wise Cli----consider as Powershell,Azure shell
Tablet has AzurePortal- that is used to connect from there to VM
upvoted 3 times

Question #182

Topic 1

A team of developers at your company plans to deploy, and then remove, 50 virtual machines each week. All the virtual machines are configured by using Azure Resource Manager templates.

You need to recommend which Azure service will minimize the administrative effort required to deploy and remove the virtual machines.

What should you recommend?

- A. Azure Reserved Virtual Machine (VM) Instances
- B. Azure DevTest Labs
- C. Azure virtual machine scale sets
- D. Azure Virtual Desktop

Correct Answer: B

DevTest Labs creates labs consisting of pre-configured bases or Azure Resource Manager templates.

By using DevTest Labs, you can test the latest versions of your applications by doing the following tasks:

- ☞ Quickly provision Windows and Linux environments by using reusable templates and artifacts.
- ☞ Easily integrate your deployment pipeline with DevTest Labs to provision on-demand environments.
- ☞ Scale up your load testing by provisioning multiple test agents and create pre-provisioned environments for training and demos.

- Riyaaaaa**

Most Recent

1 month, 3 weeks ago

According to Chatgpt: To minimize the administrative effort required to deploy and remove the virtual machines, you should recommend using Azure Virtual Machine Scale Sets (VMSS).

Azure Virtual Machine Scale Sets allow you to deploy and manage a set of identical virtual machines as a group. VMSS provides automatic scaling, load balancing, and high availability for the virtual machines within the set. It simplifies the process of creating, deploying, and managing a large number of virtual machines.

<https://learn.microsoft.com/en-us/azure/devtest-labs/devtest-lab-overview>

upvoted 2 times
- pmish05**

5 months, 3 weeks ago

Azure Dev test lab would be the correct one.

upvoted 4 times
- Souban07**

7 months, 2 weeks ago

Selected Answer: C

I would recommend using Azure virtual machine scale sets (Option C) to minimize the administrative effort required to deploy and remove the virtual machines.

Azure virtual machine scale sets provide automatic scaling and management of multiple virtual machines. With scale sets, you can quickly deploy, update, and manage a large number of VMs, and you can automate the process of creating, configuring, and deleting VMs using Azure Resource Manager templates.

By using virtual machine scale sets, you can reduce the administrative effort required to deploy and remove the virtual machines, as the process can be automated and managed at scale. Additionally, you can use scale sets to monitor and maintain the availability of your VMs, which is especially useful when you have a large number of VMs to manage.

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
Azure Advisor provides recommendations on how to improve the security of an Azure Active Directory (Azure AD) environment.	☐	☐
Azure Advisor provides recommendations on how to reduce the cost of running Azure virtual machines.	☐	☐
Azure Advisor provides recommendations on how to configure the network settings on Azure virtual machines.	☐	☐

Correct Answer:

Statements	Yes	No
Azure Advisor provides recommendations on how to improve the security of an Azure Active Directory (Azure AD) environment.	☐	☒
Azure Advisor provides recommendations on how to reduce the cost of running Azure virtual machines.	☒	☐
Azure Advisor provides recommendations on how to configure the network settings on Azure virtual machines.	☐	☒

Box 1: No -

Azure Advisor provides you with a consistent, consolidated view of recommendations for all your Azure resources. It integrates with Azure Security Center to bring you security recommendations. You can get security recommendations from the Security tab on the Advisor dashboard. Examples of recommendations include restricting access to virtual machines by configuring Network Security Groups, enabling storage encryption, installing vulnerability assessment solutions.

However, Azure Advisor does not provide recommendations on how to improve the security of an Azure AD environment.

Box 2: Yes -

Advisor helps you optimize and reduce your overall Azure spend by identifying idle and underutilized resources. You can get cost recommendations from the Cost tab on the Advisor dashboard.

Box 3: No.

Azure Advisor does not provide recommendations on how to configure network settings on Azure virtual machines.

The Azure AD recommendations feature is the Azure AD specific implementation of Azure Advisor, which is a personalized cloud consultant that helps you follow best practices to optimize your Azure deployments. Azure Advisor analyzes your resource configuration and usage data to recommend solutions that can help you improve the cost effectiveness, performance, reliability, and security of your Azure resources.

Azure AD recommendations use similar data to support you with the roll-out and management of Microsoft's best practices for Azure AD tenants to keep your tenant in a secure and healthy state. The Azure AD recommendations feature provides a holistic view into your tenant's security, health, and usage.

ChatGPT says Yes, Yes, No. Azure Advisor does provide recommendations on how to improve the security of an Azure Active Directory (Azure AD) environment. Azure Advisor is a cloud-based service that offers best practice recommendations for optimizing your Azure deployments across various aspects, including security. When it comes to Azure AD, Azure Advisor can provide security-related recommendations specific to Azure AD. These recommendations are based on Microsoft's security best practices and are designed to help you enhance the security posture of your Azure AD environment. Some of the security recommendations that Azure Advisor may provide for Azure AD include:

MFA, Configure Conditional Access Policies, enabling Azure AD Security Defaults, Enable Identity Protection, Regularly Review Sign-in Logs and Security Reports.

upvoted 2 times
- Stopblindlytrustingchatbot

1 month, 3 weeks ago

This is why you shouldn't just blindly trust chat bots. You have to think critically, was Microsoft advisor designed to provide recommendations for AD, the answer in this context is no, the purpose is broader than that. Stop blindly trusting chat bots, be a human.

1 = YES:
Yes, Azure Advisor provides recommendations on how to improve the security of an Azure Active Directory (AD) environment. Azure Advisor is a free service that analyzes your Azure resource configuration and usage and provides recommendations to help improve the performance, security, and cost effectiveness of your Azure resources.

One of the categories that Azure Advisor provides recommendations for is "Security." In this category, it provides recommendations for Azure AD that can help you improve the security of your environment, such as:

Enabling multi-factor authentication (MFA) for all users
Managing user access and permissions
Configuring Azure AD Identity Protection
Enabling Azure AD Conditional Access
Configuring Azure AD Privileged Identity Management
upvoted 2 times

 **Pinha** 8 months, 3 weeks ago

Box1: Yes
Azure Advisor recommendations can include suggestions for improving the security of user access, strengthening password policies, enabling multi-factor authentication, and more. By following these recommendations, you can help to protect your Azure AD environment from potential security threats and vulnerabilities.

Box2:Yes
There's no doubt about it.

Box3:Yes
Azure Advisor recommendations can include suggestions for optimizing network settings such as configuring load balancing, enabling acceleration, and configuring network security groups. By following these recommendations, you can help to improve the performance and security of your Azure virtual machines

🗨️ 👤 **TruptiJogi** 1 year ago

Yes, Yes, No

upvoted 3 times

🗨️ 👤 **CollabGuy** 1 year ago

For me this is a YES to all of the questions.

Azure Advisor also pulls recommendations from Microsoft Defender for Cloud: "Azure Advisor also includes your recommendations from Microsoft Defender for Cloud which may include recommendations for additional resource types." (<https://docs.microsoft.com/en-us/azure/advisor/advisor-overview?source=recommendations>)

1) <https://docs.microsoft.com/en-us/azure/defender-for-cloud/features-paas> and there is written "***Azure Active Directory (Azure AD) recommendations are available only for subscriptions with enhanced security features enabled". So it means that it is available.

An example of such is the recommendation: "Accounts with owner permissions on Azure resources should be MFA enabled".

2) I didn't see many questions regarding this, so I think we all agree it's a YES.

3) For example, security advisor will tell you to enable just-in-time access control to protect your VM from internet-based brute-force attacks on the management ports. It will provide links on how to do it on NSG or AZFW. Or you can click "Fix".

Question #184

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen. You have an Azure subscription named Subscription1. You sign in to the Azure portal and create a resource group named RG1. From Azure documentation, you have the following command that creates a virtual machine named VM1. az vm create --resource-group RG1 --name VM1 --image UbuntuLTS --generate-ssh-keys

You need to create VM1 in Subscription1 by using the command.

Solution: From the Azure portal, launch Azure Cloud Shell and select PowerShell. Run the command in Cloud Shell.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: A

The command can be run in the Azure Cloud Shell. Although this question says you select PowerShell rather than Bash, the Az commands will work in PowerShell.

The Azure Cloud Shell is a free interactive shell. It has common Azure tools preinstalled and configured to use with your account. To open the Cloud Shell, just select Try it from the upper right corner of a code block. You can also launch Cloud Shell in a separate browser tab by going to <https://shell.azure.com/bash>.

you can run your Bash, and Azure CLI commands in the PowerShell console. It supports both!

upvoted 79 times
-   **Urpiano** 2 years, 8 months ago

I suppose it's correct but launching CMD commands from PowerShell can works or not, it depends how the CMD command works. Sometimes it's necessary to do supplementary actions:
<https://www.powershellmagazine.com/2013/01/02/calling-native-commands-from-powershell/>
<https://social.technet.microsoft.com/wiki/contents/articles/7703.powershell-running-executables.aspx?PageIndex=3>
<https://4sysops.com/archives/use-powershell-to-execute-an-exe/>

Don't know if this Command Shell line can be executed successfully on PowerShell, and can test it :-(

Not a fan of how MS words this question, but yes it can be done.

upvoted 1 times

  **SNBose** 6 days, 4 hours ago

Selected Answer: B

No, the provided solution does not meet the goal. Launching Azure Cloud Shell from the Azure portal and selecting PowerShell is the correct step to use the Azure CLI, but the Azure CLI command provided in the question is for creating a virtual machine using the Azure CLI, not PowerShell.

To create VM1 in Subscription1 using the provided Azure CLI command, you should:

Launch Azure Cloud Shell from the Azure portal.
Select the Bash environment (not PowerShell) because the Azure CLI commands are typically run in a Bash shell.
Run the provided Azure CLI command:

bash
Copy code
az vm create --resource-group RG1 --name VM1 --image UbuntuLTS --generate-ssh-keys
This will create VM1 in the RG1 resource group within Subscription1 using the Azure CLI in a Bash environment, which is the appropriate way to execute the given Azure CLI command.

upvoted 1 times

  **Alif3** 2 weeks, 3 days ago

Running the command in Azure Cloud Shell, whether in PowerShell or Bash, does not change the context or the subscription where the resources will be created. By default, the Azure Cloud Shell will use the default subscription associated with your Azure account, not necessarily Subscription1.

To ensure that VM1 is created in Subscription1 using the provided command, you should either:

Set the Subscription Context: You can use the az account set --subscription command to set the subscription context before running the az vm create command

upvoted 1 times

  **Rini1702** 3 weeks, 5 days ago

BASH COMMAND:
az vm create --resource-group myResourceGroup --name myVM --image UbuntuLTS --admin-username myUsername --generate-ssh-keys

POWERSHELL COMMAND:

New-AzVm -ResourceGroupName myResourceGroup -Name myVM -Image UbuntuLTS -AdminUsername myUsername -GenerateSshKeys

upvoted 2 times

  **spyder47** 1 month, 3 weeks ago

Need Azure Cli - bash here cause the command is in Bash

upvoted 1 times

  **Mehe323** 2 months ago

I am voting no because the command is not explicitly specifying the subscription while the question does.

upvoted 1 times

  **shashawk** 2 months, 1 week ago

Selected Answer: B

B. No

Explanation:

The provided solution is incorrect. The solution suggests using Azure Cloud Shell with PowerShell to run the command. However, the given command is the Azure CLI command, not a PowerShell command.

To create the virtual machine (VM1) in Subscription1 using the given command, you should use Azure Cloud Shell with the Bash environment instead of PowerShell. The Azure CLI is a command-line tool that is primarily used with Bash or other shell environments, not PowerShell.

So the correct solution would be to launch Azure Cloud Shell and select the Bash environment, then run the command `az vm create --resource-group RG1 --name VM1 --image UbuntuLTS --generate-ssh-keys` in Cloud Shell.

upvoted 3 times

  **semauni** 4 months ago

Selected Answer: B

No: this is a Bash command, which works for the Azure CLI, the other option within the Azure CloudShell. Therefore, using PowerShell to run this particular command will not work without any modifications.

upvoted 4 times

  **christovski** 4 months, 2 weeks ago

Tested this within my own environment. You can run bash commands within PowerShell in CloudShell 100%. Answer is A

upvoted 4 times

  **motekim** 7 months, 1 week ago

Yes. This command works in cloud shell Powershell. I just ran it in the portal and created the resources.

upvoted 7 times

🗨️ 👤 **viktornm** 7 months, 1 week ago

Selected Answer: A

Yes, this meets the goal.

By launching Azure Cloud Shell from the Azure portal and selecting PowerShell, you can run the Azure CLI command to create the virtual machine named VM1 in the resource group RG1 in the subscription named Subscription1. The command specifies the parameters for the virtual machine, including the resource group name, virtual machine name, image type, and SSH key generation. By running the command in Cloud Shell, you can automate the process of creating the virtual machine in your Azure environment.

upvoted 3 times

🗨️ 👤 **Souban07** 7 months, 2 weeks ago

Selected Answer: A

A. Yes, this meets the goal.

By launching Azure Cloud Shell from the Azure portal and selecting PowerShell, you can run the command to create the virtual machine (VM1) in the specified resource group (RG1) in the specified subscription (Subscription1).

The command you provided, `az vm create --resource-group RG1 --name VM1 --image UbuntuLTS --generate-ssh-keys`, creates a virtual machine using the UbuntuLTS image, generates ssh keys, and places the virtual machine in the RG1 resource group within Subscription1. Running this command in the Azure Cloud Shell with PowerShell selected will successfully create the virtual machine in the desired subscription.

The Azure Command-Line Interface (CLI) is a cross-platform command-line tool that can be installed locally on Windows computers. You can use the Azure CLI for Windows to connect to Azure and execute administrative commands on Azure resources. The Azure CLI for Windows can also be used from a browser through the Azure Cloud Shell or run from inside a Docker container.

For Windows, the Azure CLI is installed via a MSI, which gives you access to the CLI through the Windows Command Prompt (CMD) or PowerShell. When installing for Windows Subsystem for Linux (WSL), packages are available for your Linux distribution.

Question #187

Topic 1

HOTSPOT -

Several support engineers plan to manage Azure by using the computers shown in the following table:

Name	Operating system
Computer1	Windows 10
Computer2	Ubuntu
Computer3	MacOS Mojave

You need to identify which Azure management tools can be used from each computer.

What should you identify for each computer? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Computer1:	The Azure CLI and the Azure portal The Azure portal and Azure PowerShell The Azure CLI and Azure PowerShell The Azure CLI, the Azure portal, and Azure PowerShell	✓
Computer2:	The Azure CLI and the Azure portal The Azure portal and Azure PowerShell The Azure CLI and Azure PowerShell The Azure CLI, the Azure portal, and Azure PowerShell	✓
Computer3:	The Azure CLI and the Azure portal The Azure portal and Azure PowerShell The Azure CLI and Azure PowerShell The Azure CLI, the Azure portal, and Azure PowerShell	✓

Answer Area

Correct Answer:	Computer1:	The Azure CLI and the Azure portal The Azure portal and Azure PowerShell The Azure CLI and Azure PowerShell The Azure CLI, the Azure portal, and Azure PowerShell	✓
	Computer2:	The Azure CLI and the Azure portal The Azure portal and Azure PowerShell The Azure CLI and Azure PowerShell The Azure CLI, the Azure portal, and Azure PowerShell	✓
	Computer3:	The Azure CLI and the Azure portal The Azure portal and Azure PowerShell The Azure CLI and Azure PowerShell The Azure CLI, the Azure portal, and Azure PowerShell	✓

Previously, the Azure CLI (or x-plat CLI) was the only option for managing Azure subscriptions and resources from the command-line on Linux and macOS. Now with the open source and cross-platform release of PowerShell, you'll be able to manage all your Azure resources from Windows, Linux and macOS using your tool of choice, either the Azure CLI or Azure PowerShell cmdlets.

The Azure portal runs in a web browser so can be used in either operating system.

This is tricky, the question is which tools CAN be used, for all three OS, you can use azure cli or the portal for sure. But for Mac and Linux Powershell is not installed by default.

So is this case you could ASSUME that on Mac and Linux powershell is installed, in order to use azure powershell module.

upvoted 2 times

  **VIP_G** 1 year, 6 months ago

I agree... technically you CAN use all three CLI, Portal, and Powershell on all three OS BUT as you said, Ubuntu and MacOS you would have to install Powershell and for Windows you would have to install CLI. So a bit tricky. But will stick with CLI, Portal and PowerShell in all three OS. Seems like the right answer

Question #188

Topic 1

HOTSPOT -

To complete the sentence, select the appropriate option in the answer area.

Hot Area:

Answer Area

You can access Compliance Manager
from the

	▼
Azure Active Directory admin center	
Azure portal	
Microsoft 365 admin center	
Microsoft Service Trust Portal	

Answer Area

You can access Compliance Manager
from the

Correct Answer:

	▼
Azure Active Directory admin center	
Azure portal	
Microsoft 365 admin center	
Microsoft Service Trust Portal	

🗨️ 👤 **XDPhoenixx** Highly Voted 2 years, 4 months ago

Answer should be Microsoft 365 Admin Center:

"Compliance Manager has moved from the Service Trust Portal to its new location in the Microsoft 365 compliance center. All customer data has been moved over to the new location, so you can continue using Compliance Manager without interruption. Refer to the Compliance Manager documentation for setup information and to learn about new features. Although the classic version of Compliance Manager remains in the Service Trust Portal, all users are encouraged to use Compliance Manager in the Microsoft 365 compliance center."

  **mimi23** 4 months, 2 weeks ago

<https://learn.microsoft.com/en-us/microsoft-365/compliance/compliance-manager?view=o365-worldwide>

In this link at the end, it says that compliance manager is found in MS Purview - are you sure?

upvoted 1 times

  **TheITGuy22** 7 months, 1 week ago

When this question was probably written the answer was Microsoft Service Trust Portal. If you were to get this question now I'd hope the answers would be different. Technically the product is now called Microsoft Purview.

upvoted 5 times

  **XtraWest** 7 months, 2 weeks ago

In Azure, you can access Compliance Manager from the Azure portal. To access Compliance Manager, follow these steps:

Go to the Azure portal.

Click on the "All services" button in the left navigation menu.

In the "All services" search box, type "Compliance Manager" and select it from the results.

Click on the Compliance Manager service to open it.

Once you are in Compliance Manager, you can view and manage your compliance posture, assess the risk of your Azure resources, and monitor your progress towards compliance with various standards and regulations, such as ISO 27001, SOC 1, SOC 2, and others.

upvoted 1 times

  **Fosnefes** 7 months, 1 week ago

Question #189

Topic 1

HOTSPOT -

To complete the sentence, select the appropriate option in the answer area.

Hot Area:

Answer Area

Azure policies provide
Resource groups provide
Azure Resource Manager templates provide
Management groups provide

a common platform for deploying objects to a cloud infrastructure and for implementing consistency across the Azure environment.

Correct Answer:

Answer Area

Azure policies provide
Resource groups provide
Azure Resource Manager templates provide
Management groups provide

a common platform for deploying objects to a cloud infrastructure and for implementing consistency across the Azure environment.

Azure Resource Manager templates provides a common platform for deploying objects to a cloud infrastructure and for implementing consistency across the Azure environment.

Azure policies are used to define rules for what can be deployed and how it should be deployed. Whilst this can help in ensuring consistency, Azure policies do not provide the common platform for deploying objects to a cloud infrastructure.

Reference:

<https://docs.microsoft.com/en-us/azure/governance/policy/overview>

 **Huawei_55** Highly Voted 2 years, 4 months ago

Correct answer - ARM is just a template for deployment , policy/policies are just the rules that you can create and apply -you cannot use a rule to deploy - you use a common platform-ARM

upvoted 31 times

 **pprajapa** Highly Voted 2 years, 4 months ago

I think the keywords are platform and deploy. Policies do not help deploy items with Azure but ARM with templates allows us to do that. So ARM with Templates should be the right answer.

upvoted 10 times

 **Dicer** 1 year, 9 months ago

The keyword is consistency. That's why correct answer is C.

upvoted 9 times

 **Altheus** Most Recent 10 months ago

Templates give you consistency.

upvoted 2 times

 **silviogremio** 1 year, 3 months ago

Question #190

Topic 1

DRAG DROP -

Match the Azure service to the correct description.

Instructions: To answer, drag the appropriate Azure service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.

NOTE: Each correct selection is worth one point.

Select and Place:

Answer Options	Answer Area
Azure Machine Learning	Provides a digital online assistant that provides speech support
Azure IoT Hub	Uses past trainings to provide predictions that have high probability
Azure Bot Services	Provides serverless computing functionalities
Azure Functions	Processes data from millions of sensors

Correct Answer:

Answer Options	Answer Area
Azure Machine Learning	Azure Bot Services Provides a digital online assistant that provides speech support
Azure IoT Hub	Azure Machine Learning Uses past trainings to provide predictions that have high probability
Azure Bot Services	Azure Functions Provides serverless computing functionalities
Azure Functions	Azure IoT Hub Processes data from millions of sensors

Box 1:

Azure Bot Services provides a digital online assistant that provides speech support.

Bots provide an experience that feels less like using a computer and more like dealing with a person - or at least an intelligent robot. They can be used to shift simple, repetitive tasks, such as taking a dinner reservation or gathering profile information, on to automated systems that may no longer require direct human intervention. Users converse with a bot using text, interactive cards, and speech. A bot interaction can be a quick question and answer, or it can be a sophisticated conversation that intelligently provides access to services.

Box 2:

Azure Machine Learning uses past trainings to provide predictions that have high probability.

Machine learning is a data science technique that allows computers to use existing data to forecast future behaviors, outcomes, and trends. By using machine learning, computers learn without being explicitly programmed.

Forecasts or predictions from machine learning can make apps and devices smarter. For example, when you shop online, machine learning helps recommend other products you might want based on what you've bought.

Box 3:

Azure Functions provides serverless computing functionalities.

Azure Functions is a serverless compute service that lets you run event-triggered code without having to explicitly provision or manage infrastructure.

Box 4:

IoT Hub (Internet of things Hub) provides data from millions of sensors.

IoT Hub is a managed service, hosted in the cloud, that acts as a central message hub for bi-directional communication between your IoT application and the devices it manages. You can use Azure IoT Hub to build IoT solutions with reliable and secure communications between millions of IoT devices and a cloud- hosted solution backend. You can connect virtually any device to IoT Hub.

Question #191

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

An Azure administrator plans to run a PowerShell script that creates Azure resources.

You need to recommend which computer configuration to use to run the script.

Solution: Run the script from a computer that runs Windows 10 and has the Azure PowerShell module installed.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: A

A PowerShell script is a file that contains PowerShell cmdlets and code. A PowerShell script needs to be run in PowerShell. In this question, the computer has the Azure PowerShell module installed. Therefore, this solution does meet the goal.

References:

<https://docs.microsoft.com/en-us/powershell/scripting/components/ise/how-to-write-and-run-scripts-in-the-windows-powershell-ise?view=powershell-6>

Isn't Azure CLI required ?

upvoted 19 times
- Georgess

1 year, 11 months ago

The Az PowerShell module is a set of cmdlets for managing Azure resources directly from PowerShell. PowerShell provides powerful features for automation that can be leveraged for managing your Azure resources, for example in the context of a CI/CD pipeline. (<https://docs.microsoft.com/en-us/powershell/azure/new-azureps-module-az?view=azps-6.5.0>)

Correct Answer:Yes

upvoted 5 times
- Cornelius1234

2 years, 4 months ago

No. Azure Powershell and Azure CLI are 2 different things. Their functionality is very similar, however one uses Powershell syntax, while Azure CLI uses bash syntax.

upvoted 19 times
- Splay

2 years, 2 months ago

Yep, but to interact with Azure, the CLI must be installed. PowerShell on it's own doesn't suffice.

upvoted 4 times
- Stanzin

2 years, 2 months ago

If the Azure PowerShell module is installed then there's no need to have the CLI installed as well.

upvoted 15 times
- JohnDoe_232345

2 years, 1 month ago

You are correct, for example here <https://docs.microsoft.com/en-us/powershell/azure/install-az-ps?view=azps-6.3.0> you can see how to connect without Azure CLI

upvoted 3 times
- sam2k

Highly Voted

2 years, 1 month ago

Answer A. YES is correct.

Windows 10 already comes with powershell installed. Only powershell AZ modules need to be installed on top of that, which the author/question is doing.

Isn't Azure CLI required ?

upvoted 2 times
- zelovoc

1 year, 5 months ago

I have an question, in one of previous questions there was mentioned that Azure CLI is needed, with Azure CLI local powershell can be used so azure powershell is not needed and syntax is not an issue here (so far about discussions that Azure CLI uses bash syntax - I trust this is odd topic). So from my perspective - will be both solutions equal? (1) azure CLI plus powershell or 2) Azure powershell)? Do we know?

upvoted 1 times

  **RougePotatoe** 8 months, 2 weeks ago

Azure CLI is for if you want to use Bash syntax. Azure Powershell extension is for if you want to use Powershell syntax.

You can use Bash syntax in powershell but you need to install Azure CLI.

You must install Azure Powershell extension to use Local Powershell.

Question #192

Topic 1

DRAG DROP -

Match the Azure services to the correct description.

Instructions: To answer, drag the appropriate Azure service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.

NOTE: Each correct selection is worth one point.

Select and Place:

Services

Azure Functions

Azure App Service

Azure virtual machines

Azure Container Instances

Answer Area

Provide operating system virtualization

Provide portable environment for virtualized applications

Used to build, deploy, and scale web apps

Provide a platform for serverless code

Correct Answer:**Services****Answer Area**

Azure virtual machines

Provide operating system virtualization

Azure Container Instances

Provide portable environment for virtualized applications

Azure App Service

Used to build, deploy, and scale web apps

Azure Functions

Provide a platform for serverless code

Box 1:

Azure virtual machines provide operation system virtualization.

Azure Virtual Machines (VM) is one of several types of on-demand, scalable computing resources that Azure offers. Typically, you choose a VM when you need more control over the computing environment than the other choices offer.

Box 2:

Azure Container Instances provide portable environments for virtualized applications.

Containers are becoming the preferred way to package, deploy, and manage cloud applications. Azure Container Instances offers the fastest and simplest way to run a container in Azure, without having to manage any virtual machines and without having to adopt a higher-level service. Containers offer significant startup benefits over virtual machines (VMs). Azure Container Instances can start containers in Azure in seconds, without the need to provision and manage VMs.

Box 3:

Azure App Service is used to build, deploy and scale web apps.

Azure App Service is a platform-as-a-service (PaaS) offering that lets you create web and mobile apps for any platform or device and connect to data anywhere, in the cloud or on-premises. App Service includes the web and mobile capabilities that were previously delivered separately as Azure Websites and Azure Mobile Services.

Box 4:

Azure Functions provide a platform for serverless code.

Azure Functions is a serverless compute service that lets you run event-triggered code without having to explicitly provision or manage infrastructure.

References:

<https://docs.microsoft.com/en-us/azure/virtual-machines/windows/overview> <https://docs.microsoft.com/en-us/azure/security/fundamentals/paas-applications-using-app-services> <https://docs.microsoft.com/en-us/azure/azure-functions/> <https://docs.microsoft.com/en-us/azure/container-instances/container-instances-overview>

 **hercu**  2 years, 6 months ago

Given asnwer is wrong! Be careful!

Correct answers are as follows:

Box 1 - Azure Container Instances

"A container virtualizes the underlying OS and causes the containerized app to perceive that it has the OS." Source: <https://azure.microsoft.com/en->

us/overview/what-is-a-container/
Note: Virtual Machines virtualize underlying hardware - not the OS! - so that multiple operating system (OS) instances can run on the hardware.
Box 2 is Azure Virtual Machines
"Another application of the VM is to provide the property of machine independence. This form, called application (or process) virtualization, creates an abstracted environment (for an application), making it independent of its physical environment.
In addition to creating a portable environment in which to execute the object code, application virtualization provides an environment in which to isolate the VM from other applications running on the host."
Source: <https://www.ibm.com/developerworks/library/l-virtual-machine-architectures/index.html>
Box 3 - Azure App Service
Box 4 - Azure Functions
upvoted 75 times

  **escflow** 2 months ago
These answers are wrong indeed, it should be:
Box 1 - Azure Container Instances
Box 2 - Azure Container Instances
Box 3 - Azure App Services
Box 4 - Azure Functions

If in doubt about Box 1 & 2, read the following URL from Azure Microsoft: <https://azure.microsoft.com/en-us/resources/cloud-computing-dictionary/what-is-a-container/>

It specifically states the following: "A container virtualizes the underlying OS and causes the containerized app to perceive that it has the OS—including CPU, memory, file storage, and network connections—all to itself"

While for a VM it states: "At a high level, VMs virtualize the underlying hardware so that multiple operating system (OS) instances can run on the hardware"

Soooo the difference between a VM and a container is, a VM virtualizes the hardware while a container virtualizes the OS.
upvoted 2 times

  **Acai** 2 years, 2 months ago
Definitely not my guy, no matter how many links you post. The currently given answers are correct.
Box 1 Virtual Machines - OS virtualization is exactly what a VM is
Box 2 Azure Container Instances - Containers are portable instances for virtual apps
Box 3 Azure App Services - Build deploy & scale web apps
Box 4 Azure Functions - serverless code
upvoted 79 times

  **alexandru_chirita** 1 year, 11 months ago
I have a problem with Box 1:
Operating System virtualization happens in "Virtual Machines", "Azure Container Instances" (Docker can be used and is also an OS virtualization), "Azure App Services" also might use OS virtualization and "Azure Functions" also might use OS virtualization.

The more I read about OS virtualization the more I thought most Azure services rely on it. Even though "Virtual Machines" might be the first to rely on OS virtualization (VMWare is an example of "OS virtualization" technology, so.. yeah).
upvoted 1 times

  **Irodriguez** 3 months ago
Dear hercu, stop giving wrong answers. How can you think that Azure VMs provide portable environments instead of Container Instances? If you don't know about containers, or you are not sure about specific topics, please, don't comment anymore!

  **Suhailahmed648** 2 years, 4 months ago
No, It's Incorrect! 1 & 2 should be swapped.
upvoted 3 times

  **BigBang82**  2 weeks, 5 days ago

This is simply poorly worded by MS. VM can virtualize hardware and OS while containers can virtualize OS (no hardware). Since the first option only says "Provide operating system virtualization" without mentioning hardware or portability both VM and Containers satisfy condition.
Box1: VM/Containers (both correct), choose whatever
Box2: Containers - keyword portable
Box3: App Service
Box4: Functions
upvoted 1 times

  **sj1234567** 1 month, 3 weeks ago
@escflow is correct.
Box 1 - Azure Container Instances
Box 2 - Azure Container Instances
Box 3 - Azure App Services
Box 4 - Azure Functions

VM virtualizes hardware resources using hypervisor technique to run multiple OS on same underlying hardware.
upvoted 1 times

  **Hoeishetmogelijk** 4 months, 1 week ago
Answer should be:
1. Azure Container Instances
2. Azure Container Instances
3. Azure App Service
4. Azure Functions

As explanation for choice of 1 and 2:
A container virtualizes the underlying OS and causes the containerized app to perceive that it has the OS—including CPU, memory, file storage, and network connections—all to itself. Because the differences in underlying OS and infrastructure are abstracted, as long as the base image is consistent, the container can be deployed and run anywhere. For developers, this is incredibly attractive.

From page: <https://azure.microsoft.com/en-us/resources/cloud-computing-dictionary/what-is-a-container/>
upvoted 3 times

  **BabyYodalsCute** 4 months, 4 weeks ago
Each answer can be used more than once, so it's container services x 2

Containers are a virtualization environment for running applications. Just like virtual machines, containers are run on top of a host operating system but unlike VMs, they don't include an operating system for the apps running inside the container. Reading this makes me think Box 1 is VM and Box 2 Azure Container Instances
upvoted 1 times

  **ram75** 1 year, 8 months ago

Container - Virtualizes the OS.
Virtual Machine - Virtualize the hardware.
Box 1 - Should be Container.
Box 2 - Should be Container too.
Box 3 - Azure App Service
Box 4 - Azure Functions
upvoted 10 times

  **NevilleV** 1 year ago

You are wrong. The given answer is correct. Box1 Provide OS virtualisation. That's exactly what a virtual machine is.
upvoted 1 times

  **ABarrios** 1 year, 8 months ago

I got this question in the exam 20/01/2022
upvoted 1 times

  **kamee15** 1 year, 8 months ago

Hi Guys. The description below taken from IBM but its worth a read about containers
What are containers?
Containers are a lighter-weight, more agile way of handling virtualization — since they don't use a hypervisor, you can enjoy faster resource provisioning and speedier availability of new applications.

Rather than spinning up an entire virtual machine, containerization packages together everything needed to run a single application or microservice (along with runtime libraries they need to run). The container includes all the code, its dependencies and even the operating system itself. This enables applications to run almost anywhere — a desktop computer, a traditional IT infrastructure or the cloud.

Containers use a form of operating system (OS) virtualization. Put simply, they leverage features of the host operating system to isolate processes and control the processes' access to CPUs, memory and desk space.

Question #193

Topic 1

Which service provides serverless computing in Azure?

- A. Azure Virtual Machines
- B. Azure Functions
- C. Azure storage account
- D. Azure dedicated hosts

Correct Answer: *B*

Azure Functions provide a platform for serverless code.

Azure Functions is a serverless compute service that lets you run event-triggered code without having to explicitly provision or manage infrastructure.

Reference:

<https://docs.microsoft.com/en-us/azure/azure-functions/>

Question #194

Topic 1

An Azure administrator plans to run a PowerShell script that creates Azure resources. You need to recommend which computer configuration to use to run the script. Which three computers can run the script? Each correct answer presents a complete solution. NOTE: Each correct selection is worth one point.

- A. a computer that runs macOS and has PowerShell Core 6.0 installed.
- B. a computer that runs Windows 10 and has the Azure PowerShell module installed.
- C. a computer that runs Linux and has the Azure PowerShell module installed.
- D. a computer that runs Linux and has the Azure CLI tools installed.
- E. a computer that runs Chrome OS and uses Azure Cloud Shell.

Correct Answer: ABE

A PowerShell script is a file that contains PowerShell cmdlets and code. A PowerShell script needs to be run in PowerShell.

Reference:

<https://docs.microsoft.com/en-us/powershell/scripting/components/ise/how-to-write-and-run-scripts-in-the-windows-powershell-ise?view=powershell-6> <https://docs.microsoft.com/en-us/azure/cloud-shell/quickstart-powershell>

Azure Powershell module needs to be installed, without which powershell scripts can't be executed.
Just having Powershell Core 6.0 is not enough- Need Powershell Module to be installed.

Note: Azure Powershell supports Microsoft, Linux, MacOS, but needs Azure Powershell to be installed.

upvoted 4 times

  **yosri_c_sharp** 8 months, 1 week ago

I Think:

A: False, PowerShell core not enough

B: True

C: True

D:True, Azure Cli can execute Powershell commands

E:False, Azure PowerShell is not supported by default for Chrome OS

upvoted 1 times

  **maddiganed** 3 months, 3 weeks ago

D is not true because CLI itself is not enough to execute Powershell commands, you need also the Powershell module, which is not mentioned

upvoted 1 times

  **Luansi** 8 months, 2 weeks ago

Selected Answer: BCE

B, C, and E are the three computers that can run the script.

upvoted 3 times

  **Hakax** 9 months ago

I had this question 22/12/2022.

ABE were the only 3 good answers as the other computers were windows and linux with CLI. So the macos with powershell 6.0 is good answer also.

I had to choose 3.

There where mac os with powershell core 6.0

Windows with powershell module

Chrome os with cloudshell

Linux with cli

Windows with cli.

Mac os is also good answer. I had 925/1000 score

upvoted 3 times

  **AULABI22** 8 months, 2 weeks ago

macOS with PowerShell Core 6.0 is still not a good answer. In your question, Windows with Azure CLI tools is valid, as Windows PowerShell 5.1 comes by default in the operating system.

upvoted 1 times

  **hotwheelsinsf** 11 months, 1 week ago

PowerShell 7.0 or higher require macOS 10.13 and higher. Straight from Azure Documentation. Why are there so many errors in these sample tests?????

upvoted 4 times

Question #195

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen. You have an Azure subscription named Subscription1. You sign in to the Azure portal and create a resource group named RG1. From Azure documentation, you have the following command that creates a virtual machine named VM1. az vm create --resource-group RG1 --name VM1 --image UbuntuLTS --generate-ssh-keys

You need to create VM1 in Subscription1 by using the command.

Solution: From the Azure portal, launch Azure Cloud Shell and select Bash. Run the command in Cloud Shell.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: A

The command can be run in the Azure Cloud Shell.

The Azure Cloud Shell is a free interactive shell. It has common Azure tools preinstalled and configured to use with your account. To open the Cloud Shell, just select Try it from the upper right corner of a code block. You can also launch Cloud Shell in a separate browser tab by going to <https://shell.azure.com/bash>.

Community vote distribution

A (53%)

B (35%)

12%

- sham21**

Highly Voted

2 years, 4 months ago

Answer is correct but need to understand why subscription and resource group are mentioned in question. While using the command subscription is not mentioned and some of us would look why subscription command was not used however all details mentioned in question was mentioned. For creating a virtual machine though power shall or bas, there is no requirement to put the subscription details. Name of VM and resource group are sufficient to create a vm.

upvoted 25 times
- mauchi**

2 years, 3 months ago

I think the fact that you launch the Cloud shell from the Azure portal already implies that you have a subscription.

upvoted 10 times
- Nilvam**

2 years, 4 months ago

*From Cloud shell, yes.

upvoted 1 times
- Violoncello**

2 years, 2 months ago

There are lots of assumptions. The question says "You have a subscription named Subscription1". Assume that's the only subscription. When you create RG1, it must go under a subscription. Subscription1 is the only subscription it will go to. By adding a VM to RG1, (and RG1 being under Subscription1), your goal is achieved. That is, if you assume things correctly.

upvoted 4 times
- Luansi**

Highly Voted

8 months, 2 weeks ago

Selected Answer: B

The command that is provided is for the Azure CLI (Command Line Interface) and specifically for the az vm create command, which is used to create a virtual machine using the Azure CLI.

While it's true that you can launch the Azure Cloud Shell from the Azure portal, Cloud Shell supports both PowerShell and Bash and it can be used to run Azure CLI commands, the command provided is written in PowerShell and the solution is suggesting to use Bash shell, which will not be able to execute this command correctly.

upvoted 6 times
- Ajay_J**

upvoted 2 times

🗉 👤 **yoobro** 1 year, 1 month ago

To create Resource grp:-
az group create --name myResourceGroup --location eastus
To create VM:-
az vm create \
--resource-group myResourceGroup \
--name myVM \
--image Debian \
--admin-username azureuser \
--generate-ssh-keys

The Above process creates Resource grp and VM

The Command That given in the question give the output as below:-
az vm create --resource-group RG1 --name VM1 --image UbuntuLTS --generate-ssh-keys
(ResourceGroupNotFound) Resource group 'RG1' could not be found.
Code: ResourceGroupNotFound
Message: Resource group 'RG1' could not be found.

So Ans is NO
upvoted 1 times

🗉 👤 **CHRIS12722222** 1 year, 1 month ago

You answer is incorrect.
The question says "You have an Azure subscription named Subscription1. You sign in to the Azure portal and create a resource group named RG1" meaning subscription and RG1 already exist

upvoted 1 times

  **Pa1theAchiever** 1 year, 2 months ago

option A
upvoted 1 times

  **ttm_19** 1 year, 8 months ago

If the question is: Can you run the command in Cloud Shell, then - Yes, you can!
If the question is - Is it going to work, then - It depends!
If you have (access to) ONLY one subscription - Subscription1, then - Yes, it will work.
If you have more subscription, then by simply running the Command Shell, you may land on a different context/subscription, and then the command won't work (unless, by chance there is a resource group with the same name in that different subscription).
If this is the case, than before executing the command, you need to execute:
az account set -subscription Subscription1
in order to set the current cloud shell context to the subscription that is needed.
upvoted 3 times

Question #196

Topic 1

Your company has several business units.

Each business unit requires 20 different Azure resources for daily operation. All the business units require the same type of Azure resources.

You need to recommend a solution to automate the creation of the Azure resources.

What should you include in the recommendations?

- A. Azure Resource Manager templates
- B. virtual machine scale sets
- C. the Azure API Management service
- D. management groups

Correct Answer: A

You can use Azure Resource Manager templates to automate the creation of the Azure resources. Deploying resource through templates is known as 'Infrastructure as code'.

To implement infrastructure as code for your Azure solutions, use Azure Resource Manager templates. The template is a JavaScript Object Notation (JSON) file that defines the infrastructure and configuration for your project. The template uses declarative syntax, which lets you state what you intend to deploy without having to write the sequence of programming commands to create it. In the template, you specify the resources to deploy and the properties for those resources.

No. Just try on Azure Portal under Cost Management. When I try to get the costs associated with my Tenant Root Group, i get this error message :

Resources not available

Resources are only available when selecting a subscription or resource group. Please change scope to view resources or try the Resource groups view.

So Straightforward, N Y Y

upvoted 18 times

  **Harry28731** 1 year, 10 months ago

Sorry, tried again by creating a management group and it worked (after moving the subscription under it). So Y Y Y.

<https://learn.microsoft.com/en-us/azure/cost-management-billing/cost-management-billing-overview>
upvoted 1 times

  **mihir25** 3 weeks, 4 days ago

Cost Management is available from within the Billing experience. It's also available from every subscription, resource group, and management group in the Azure portal. The availability is to ensure everyone has full visibility into the costs they're responsible for. And, so they can optimize their workloads to maximize efficiency. Cost Management is also available independently to streamline the process for managing cost across multiple billing accounts, subscriptions, resource groups, and management groups.

How Cost Management and Billing relate
Cost Management is a set of FinOps tools that enable you to analyze, manage, and optimize your costs.

Billing provides all the tools you need to manage your billing account and pay invoices.

Cost Management is available from within the Billing experience. It's also available from every subscription, resource group, and management group in the Azure portal. The availability is to ensure everyone has full visibility into the costs they're responsible for. And, so they can optimize their workloads to maximize efficiency. Cost Management is also available independently to streamline the process for managing cost across multiple billing accounts, subscriptions, resource groups, and management groups.

Question #198

Topic 1

What can you use to identify underutilized or unused Azure virtual machines?

- A. Azure Advisor
- B. Azure Cost Management + Billing
- C. Azure reservations
- D. Azure Policy

Correct Answer: A

Azure Advisor helps you optimize and reduce your overall Azure spend by identifying idle and underutilized resources. You can get cost recommendations from the Cost tab on the Advisor dashboard.

Reference:

<https://docs.microsoft.com/en-us/azure/advisor/advisor-overview>

upvoted 1 times
- LadyRose

4 months ago

Selected Answer: A

You can use Azure Advisor to identify underutilized or unused Azure virtual machines. Azure Advisor provides recommendations to optimize your Azure resources, including identifying underutilized or unused virtual machines. It analyzes usage patterns and provides recommendations to right-size or decommission virtual machines that are not being used or are underutilized. Azure Cost Management + Billing can also help identify underutilized virtual machines by providing cost analysis and usage reports. However, Azure Advisor is specifically designed to provide optimization recommendations for Azure resources. Azure reservations and Azure Policy are not directly related to identifying underutilized or unused virtual machines.
upvoted 2 times
- speedyweedy

4 months, 4 weeks ago

Selected Answer: B

Answer is B

Yes, that's correct. Azure Cost Management provides a unified view of your organization's Azure spending and usage across all Azure subscriptions, resource groups, and management groups. With Azure Cost Management, you can view and manage usage data for your virtual machines.

To view the usage of virtual machines during the last three months in Azure Cost Management, you can follow these steps:

1. Sign in to the Azure portal and navigate to the Azure Cost Management and Billing page.

2. Select the desired scope (such as a subscription or resource group) from the dropdown menu at the top of the page.

3. Click on the "Cost analysis" tab to view cost and usage data for the selected scope.

4. Use the filters at the top of the page to select the desired date range (such as the last three months).

5. Select the "Usage" option from the "Group by" dropdown menu.

6. Use the filters and grouping options to further refine the usage data for your virtual machines.

 Policies

 Properties

Answer Area

Correct Answer:

Settings

Box 1: Overview -

When you assign roles, you must specify a scope. Scope is the set of resources the access applies to. In Azure, you can specify a scope at four levels from broad to narrow: management group, subscription, resource group, and resource.

1. Sign in to the Azure portal.
2. In the Search box at the top, search for the scope you want to grant access to. For example, search for Management groups, Subscriptions, Resource groups, or a specific resource.
3. Click the specific resource for that scope.
4. The following shows an example resource group.

Box 2: Access control (IAM)

Access control (IAM) is the page that you typically use to assign roles to grant access to Azure resources. It's also known as identity and

access management

(IAM) and appears in several locations in the Azure portal.

1. Click Access control (IAM).

The following shows an example of the Access control (IAM) page for a resource group.

2. Click the Role assignments tab to view the role assignments at this scope.

3. Click Add > Add role assignment.

If you don't have permissions to assign roles, the Add role assignment option will be disabled.

4. The Add role assignment page opens.

Reference:

<https://docs.microsoft.com/en-us/azure/role-based-access-control/role-assignments-portal>

K2001 Highly Voted 1 year ago

Has anyone actually seen this question on the test? The question asks which node (singular) is to be selected. I don't understand why "Overview" is being highlighted. I would say that "IAM" is the only node that should be selected.

So many of the answers to these questions confuse me. Rather than testing your working knowledge of Azure, they test your ability to deconstruct the questions and rationalize the answers.

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
You must have internet connectivity to manage cloud services.	☐	☐
You must install a management app to manage cloud services.	☐	☐
You can manage cloud services from any modern web browser.	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
You must have internet connectivity to manage cloud services.	☒	☐
You must install a management app to manage cloud services.	☐	☒
You can manage cloud services from any modern web browser.	☒	☐

Box 1: Yes -

Box 2: No -

Cloud services can be managed through <https://portal.azure.com/>

In the Cloud Services area of the Azure portal, you can:

- Update a service role or a deployment.
- Promote a staged deployment to production.
- Link resources to your cloud service so that you can see the resource dependencies and scale the resources together.
- Delete a cloud service or a deployment.

Box 3: Yes -

Question #202

Topic 1

DRAG DROP -

Match the Azure service to the correct definition.

Instructions: To answer, drag the appropriate Azure service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.

NOTE: Each correct selection is worth one point.

Select and Place:

Answer Options	Answer Area
Azure Databricks	Provides the platform for serverless code
Azure Functions	A big data analysis service for machine learning
Azure App Service	Detects and diagnoses anomalies in web apps
Azure Application Insights	Hosts web apps

Correct Answer:

Answer Options	Answer Area
Azure Databricks	Azure FunctionsProvides the platform for serverless code
Azure Functions	Azure DatabricksA big data analysis service for machine learning
Azure App Service	Azure Application InsightsDetects and diagnoses anomalies in web apps
Azure Application Insights	Azure App ServiceHosts web apps

Box 1:

Azure Functions provides the platform for serverless code.

Azure Functions is a serverless compute service that lets you run event-triggered code without having to explicitly provision or manage infrastructure.

Box 2:

Azure Databricks is a big analysis service for machine learning.

Azure Databricks is an Apache Spark-based analytics platform. The platform consists of several components including 'MLib'. Mlib is a Machine Learning library consisting of common learning algorithms and utilities, including classification, regression, clustering, collaborative filtering, dimensionality reduction, as well as underlying optimization primitives.

Box 3:

Azure Application Insights detects and diagnoses anomalies in web apps.

Application Insights, a feature of Azure Monitor, is an extensible Application Performance Management (APM) service for developers and DevOps professionals.

Use it to monitor your live applications. It will automatically detect performance anomalies, and includes powerful analytics tools to help you diagnose issues and to understand what users actually do with your app.

Box 4:

Azure App Service hosts web apps.

Azure App Service is an HTTP-based service for hosting web applications, REST APIs, and mobile back ends. You can develop in your favorite language, be it .NET, .NET Core, Java, Ruby, Node.js, PHP, or Python. Applications run and scale with ease on both Windows and Linux-based environments.

Question #203

Topic 1

A team of developers at your company plans to deploy, and then remove, 50 customized virtual machines each week. Thirty of the virtual machines run Windows Server 2016 and 20 of the virtual machines run Ubuntu Linux. You need to recommend which Azure service will minimize the administrative effort required to deploy and remove the virtual machines. What should you recommend?

- A. Azure Reserved Virtual Machines (VM) Instances
- B. Azure virtual machine scale sets
- C. Azure DevTest Labs
- D. Microsoft Managed Desktop

Correct Answer: C

DevTest Labs creates labs consisting of pre-configured bases or Azure Resource Manager templates. By using DevTest Labs, you can test the latest versions of your applications by doing the following tasks:

☞ Quickly provision Windows and Linux environments by using reusable templates and artifacts.

☞ Easily integrate your deployment pipeline with DevTest Labs to provision on-demand environments.

☞ Scale up your load testing by provisioning multiple test agents and create pre-provisioned environments for training and demos.

upvoted 4 times

  **azirila** 8 months, 1 week ago

answer is correct and more explanation for answer 1:

There are several ways to install PowerShell on macOS. Choose one of the following methods:

Install using Homebrew. Homebrew is the preferred package manager for macOS.

Install PowerShell via Direct Download

Install from binary archives.

If the brew command isn't found, you need to install Homebrew following their instructions.

Bash

Copy

```
/bin/bash -c "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/HEAD/install.sh)"
```

Now, you can install PowerShell:

sh

Copy

```
brew install --cask powershell
```

Finally, verify that your install is working properly:

sh

Copy

```
pwsh
```

When new versions of PowerShell are released, update Homebrew's formulae and upgrade PowerShell:

sh

Copy

```
brew update
```

```
brew upgrade powershell --cask
```

upvoted 1 times

Question #205

Topic 1

A support engineer plans to perform several Azure management tasks by using the Azure CLI.
You install the CLI on a computer.
You need to tell the support engineer which tools to use to run the CLI.
Which two tools should you instruct the support engineer to use? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

- A. Command Prompt
- B. Azure Resource Explorer
- C. Windows PowerShell
- D. Windows Defender Firewall
- E. Network and Sharing Center

Correct Answer: AC

For Windows the Azure CLI is installed via an MSI, which gives you access to the CLI through the Windows Command Prompt (CMD) or PowerShell.

Question #206

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You have an Azure environment. You need to create a new Azure virtual machine from a tablet that runs the Android operating system.

Solution: You use PowerShell in Azure Cloud Shell.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: A

Azure Cloud Shell is a browser-based shell experience to manage and develop Azure resources.

Cloud Shell offers a browser-accessible, pre-configured shell experience for managing Azure resources without the overhead of installing, versioning, and maintaining a machine yourself.

Being browser-based, Azure Cloud Shell can be run on a browser from a tablet that runs the Android operating system.

B. No

The solution described does not meet the goal.

Using PowerShell in Azure Cloud Shell is a valid way to manage and interact with your Azure resources, but the statement specifically mentions creating a new Azure virtual machine from a tablet that runs the Android operating system.

As of my last update in September 2021, Azure Cloud Shell is not available as a native application for Android devices. Azure Cloud Shell is accessible through web browsers on devices like Windows, macOS, and Linux, but there is no official Azure Cloud Shell app for Android.

Therefore, the correct answer is B. No, using PowerShell in Azure Cloud Shell from an Android tablet is not currently possible. To create a new Azure virtual machine from an Android device, you may consider using the Azure portal in the web browser or a third-party app that provides remote access to a computer running PowerShell or the Azure CLI.

Question #207

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You have an Azure environment. You need to create a new Azure virtual machine from a tablet that runs the Android operating system.

Solution: You use the PowerApps portal.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: B

PowerApps lets you quickly build business applications with little or no code. It is not used to create Azure virtual machines. Therefore, this solution does not meet the goal.

PowerApps Portals allow organizations to create websites which can be shared with users external to their organization either anonymously or through the login provider of their choice like LinkedIn, Microsoft Account, other commercial login providers.

Question #208

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen. You have an Azure environment. You need to create a new Azure virtual machine from a tablet that runs the Android operating system. Solution: You use the Azure portal. Does this meet the goal?

- A. Yes
- B. No

Correct Answer: A

The Azure portal is a web-based, unified console that provides an alternative to command-line tools. With the Azure portal, you can manage your Azure subscription using a graphical user interface. You can build, manage, and monitor everything from simple web apps to complex cloud deployments. Create custom dashboards for an organized view of resources. Configure accessibility options for an optimal experience. Being web-based, the Azure portal can be run on a browser from a tablet that runs the Android operating system.

Question #209

Topic 1

HOTSPOT -

Select the answer that correctly completes the sentence.

Hot Area:

	▼
The Microsoft 365 Compliance admin center	
The Microsoft 365 Defender portal	
Microsoft Defender for Cloud in the Azure portal	
Microsoft Trust Center	

provides in-depth information about security, privacy, compliance offerings, policies, and features across Microsoft cloud products.

Correct Answer:

	▼
The Microsoft 365 Compliance admin center	
The Microsoft 365 Defender portal	
Microsoft Defender for Cloud in the Azure portal	
Microsoft Trust Center	

provides in-depth information about security, privacy, compliance offerings, policies, and features across Microsoft cloud products.

Microsoft 365 compliance is now called Microsoft Purview and the solutions within the compliance area have been rebranded. When you first visit the compliance portal, the card section on the home page shows you at a glance how your organization is doing with data compliance, what solutions are available for your organization, and a summary of any active alerts. From here, you can:

- * Review the Microsoft Purview Compliance Manager card, which leads you to the Compliance Manager solution. Compliance Manager helps simplify the way you manage compliance.
- * Review the new Solution catalog card, which links to collections of integrated solutions you can use to help you manage end-to-end compliance scenarios. A solution's capabilities and tools might include a combination of policies, alerts, reports, and more.
- * Review the Active alerts card, which includes a summary of the most active alerts and includes a link where you can view more detailed information, such as Severity, Status, Category, and more.

Question #210

Topic 1

HOTSPOT -

Select the answer that correctly completes the sentence.

Hot Area:

You can manage an on-premises Windows server as an Azure resource by using

Azure AD Connect.
Azure Arc.
an Azure Pipelines agent.
Azure VPN Gateway.

Correct Answer:

You can manage an on-premises Windows server as an Azure resource by using

Azure AD Connect.
Azure Arc.
an Azure Pipelines agent.
Azure VPN Gateway.

Azure Arc simplifies governance and management by delivering a consistent multi-cloud and on-premises management platform. Azure Arc provides a centralized, unified way to:

Manage your entire environment together by projecting your existing non-Azure and/or on-premises resources into Azure Resource Manager. Manage virtual machines, Kubernetes clusters, and databases as if they are running in Azure.

Etc.

Incorrect:

* Why use Azure AD Connect?

Integrating your on-premises directories with Azure AD makes your users more productive by providing a common identity for accessing both cloud and on- premises resources. Users and organizations can take advantage of:

Users can use a single identity to access on-premises applications and cloud services such as Microsoft 365.

Single tool to provide an easy deployment experience for synchronization and sign-in.

Provides the newest capabilities for your scenarios. Azure AD Connect replaces older versions of identity integration tools such as DirSync and Azure AD Sync.

* VPN Gateway sends encrypted traffic between an Azure virtual network and an on-premises location over the public Internet. You can also use VPN Gateway to send encrypted traffic between Azure virtual networks over the Microsoft network. A VPN gateway is a specific type of virtual network gateway.

* Pipeline agent is machine where your build is performed. An agent is installable software that runs one job at a time. Agent job is a set of steps which is recognized as execution boundary. Each job runs on an agent. All of the steps run together on the same agent.

11 months, 2 weeks ago

Answer No Yes Yes

You can only manage cloud services from windows devices - No. You can connect to your Cloud PC on any platform that has either the Microsoft Remote Desktop app or an HTML5-capable browser to access the web client. Windows devices will provide the optimal experience

You can manage cloud services from the command line >> Yes

You can manage cloud services by using a web browser >> Yes . Microsoft Azure is an example of a public cloud. With a public cloud, all hardware, software and other supporting infrastructure is owned and managed by the cloud provider. You access these services and manage your account using a web browser.

Question #213

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
Azure Monitor can monitor the performance of on-premises computers.	☐	☐
Azure Monitor can send alerts to Azure Active Directory security groups.	☐	☐
Azure Monitor can trigger alerts based on data in an Azure Log Analytics workspace.	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
Azure Monitor can monitor the performance of on-premises computers.	☒	☐
Azure Monitor can send alerts to Azure Active Directory security groups.	☒	☐
Azure Monitor can trigger alerts based on data in an Azure Log Analytics workspace.	☒	☐

Box 1: Yes -

Azure Monitor maximizes the availability and performance of your applications and services by delivering a comprehensive solution for collecting, analyzing, and acting on telemetry from your cloud and on-premises environments.

Box 2: Yes -

Alerts in Azure Monitor proactively notify you of critical conditions and potentially attempt to take corrective action.

Box 3: Yes -

Azure Monitor uses Target Resource, which is the scope and signals available for alerting. A target can be any Azure resource. Example targets: a virtual machine, a storage account, a virtual machine scale set, a Log Analytics workspace, or an Application Insights resource.

References:

  **ziggy1117**  7 months ago

#2 YES. Active Groups... so the security group stated can be the action group

upvoted 1 times

  **Pinha** 8 months, 2 weeks ago

All of the statements are correct.

Azure Monitor can monitor the performance of on-premises computers. You can use Azure Monitor to monitor the performance and availability of your on-premises servers, as well as the performance of your applications and services running on those servers. This can help you identify and troubleshoot issues, and ensure that your on-premises systems are running smoothly.

Azure Monitor can send alerts to Azure Active Directory security groups. You can configure Azure Monitor to send alerts to one or more Azure AD security groups when certain conditions are met. This can help you ensure that the right people are notified when there are issues with your systems.

Azure Monitor can trigger alerts based on data in an Azure Log Analytics workspace. You can use Azure Monitor to set up alerts that are triggered when specific data is logged to an Azure Log Analytics workspace. This can help you identify issues and trends in your data, and take appropriate action in response.

Question #214

Topic 1

Which Azure service provides a set of version control tools to manage code?

- A. Azure Repos
- B. Azure DevTest Labs
- C. Azure Storage
- D. Azure Cosmos DB

Correct Answer: A

Azure Repos is a set of version control tools that you can use to manage your code.

Incorrect Answers:

B: Azure DevTest Labs creates labs consisting of pre-configured bases or Azure Resource Manager templates. These have all the necessary tools and software that you can use to create environments.

D: Azure Cosmos DB is Microsoft's globally distributed, multi-model database service.

Question #215

Topic 1

HOTSPOT -

You need to manage Azure by using Azure Cloud Shell.

Which Azure portal icon should you select? To answer, select the appropriate icon in the answer area.

Hot Area:

Answer Area

Correct Answer:

Answer Area

You can access Azure Cloud Shell in the Azure portal by clicking the icon.

Azure Cloud Shell is an interactive, authenticated, browser-accessible shell for managing Azure resources. It provides the flexibility of choosing the shell experience that best suits the way you work, either Bash or PowerShell.

Cloud Shell enables access to a browser-based command-line experience built with Azure management tasks in mind.

Question #216

Topic 1

You have a virtual machine named VM1 that runs Windows Server 2016. VM1 is in the East US Azure region.

Which Azure service should you use from the Azure portal to view service failure notifications that can affect the availability of VM1?

- A. Azure Service Fabric
- B. Azure Monitor
- C. Azure virtual machines
- D. Azure Advisor

Correct Answer: C

In the Azure virtual machines page in the Azure portal, there is a named Maintenance Status. This column will display service issues that could affect your virtual machine. A service failure is rare but host server maintenance that could affect your virtual machines is more common. Azure periodically updates its platform to improve the reliability, performance, and security of the host infrastructure for virtual machines. The purpose of these updates ranges from patching software components in the hosting environment to upgrading networking components or decommissioning hardware.

References:

<https://docs.microsoft.com/en-us/azure/virtual-machines/maintenance-and-updates>

Azure Monitor
To view service failure notifications for your VMs using Azure Monitor, you can set up alerts for specific metrics such as CPU usage, memory usage, and disk usage, and configure the alert to trigger when a threshold is crossed. You can also use Azure Monitor to monitor the health of the underlying infrastructure such as storage accounts, network resources, and virtual machines, and receive notifications when a failure occurs. Additionally, you can view logs and metrics for your VMs and other resources to troubleshoot issues and identify the root cause of service failures.
upvoted 1 times

  **speedyweedy** 4 months, 2 weeks ago

Selected Answer: B

To view service failure notifications that can affect the availability of virtual machines in Azure, you should use Azure Monitor rather than Azure Virtual Machines.
Azure Monitor is a platform service that provides a unified solution for collecting, analyzing, and acting on telemetry data from various Azure resources, including virtual machines. It allows you to monitor the health and performance of your virtual machines, and to receive alerts and notifications when issues arise that could affect the availability of your VMs.
Azure Virtual Machines, on the other hand, is a compute service that allows you to create and manage virtual machines in Azure, but it does not provide native monitoring or alerting capabilities. While you can view basic performance metrics and logs for your VMs in the Azure portal, you will not receive notifications or alerts for service failures or other issues that could impact the availability of your VMs without configuring Azure Monitor.
upvoted 1 times

  **Thegracie** 6 months, 1 week ago

Azure Virtual Machines is a service to create and manage virtual machines, but it does not provide specific information about service failure notifications that can affect the availability of VM1.

On the other hand, Azure Monitor is a monitoring service that provides alerts and notifications for Azure resources, including virtual machines. Therefore, the correct answer to the question would be B. Azure Monitor.

  **azirila** 8 months, 1 week ago

Service health notifications are published by the Azure infrastructure into the Azure activity log. The notifications contain information about the resources under your subscription. Given the possibly large volume of information stored in the activity log, there is a separate user interface to make it easier to view and set up alerts on service health notifications.

Service health notifications can be informational or actionable, depending on the class.

For more information on the various classes of service health notifications, see Service health notifications properties.
upvoted 1 times

  **hundredsandthousands** 8 months, 2 weeks ago
B. Monitor

Service health notifications are published by the Azure infrastructure into the Azure activity log. The notifications contain information about the resources under your subscription.

View your service health notifications in the Azure portal

In the Azure portal, select Monitor.

Azure Monitor brings together all your monitoring settings and data into one consolidated view. It first opens to the Activity log section.

Select Alerts.

Select +Add activity log alert, and set up an alert to ensure you are notified for future service notifications

Question #217

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

Your Azure environment contains multiple Azure virtual machines.

You need to ensure that a virtual machine named VM1 is accessible from the Internet over HTTP.

Solution: You modify an Azure Traffic Manager profile.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: B

Azure Traffic Manager is a DNS-based load balancing solution. It is not used to ensure that a virtual machine named VM1 is accessible from the Internet over HTTP.

To ensure that a virtual machine named VM1 is accessible from the Internet over HTTP, you need to modify a network security group or Azure Firewall.

In this question, we need to add a rule to a network security group or Azure Firewall to allow the connection to the virtual machine on port 80 (HTTP).

Question #218

Topic 1

Your company plans to deploy several web servers and several database servers to Azure.

You need to recommend an Azure solution to limit the types of connections from the web servers to the database servers.

What should you include in the recommendation?

- A. network security groups (NSGs)
- B. Azure Service Bus
- C. a local network gateway
- D. a route filter

Correct Answer: A

A network security group works like a firewall. You can attach a network security group to a virtual network and/or individual subnets within the virtual network.

You can also attach a network security group to a network interface assigned to a virtual machine. You can use multiple network security groups within a virtual network to restrict traffic between resources such as virtual machines and subnets.

You can filter network traffic to and from Azure resources in an Azure virtual network with a network security group. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources.

Question #219

Topic 1

HOTSPOT -

To complete the sentence, select the appropriate option in the answer area.

Hot Area:

Answer Area

From

Azure Access Control IAM

Azure Event Hubs

Azure Activity Log

Azure Service Health

you can view which user turned off a specific virtual machine during the last 14 days.

Correct Answer:

Answer Area

From

Azure Access Control IAM

Azure Event Hubs

Azure Activity Log

Azure Service Health

you can view which user turned off a specific virtual machine during the last 14 days.

You would use the Azure Activity Log, not Access Control to view which user turned off a specific virtual machine during the last 14 days. Activity logs are kept for 90 days. You can query for any range of dates, as long as the starting date isn't more than 90 days in the past. In this question, we would create a filter to display shutdown operations on the virtual machine in the last 14 days.

Question #220

Topic 1

Which service provides network traffic filtering across multiple Azure subscriptions and virtual networks?

- A. Azure Firewall
- B. an application security group
- C. Azure DDoS protection
- D. a network security group (NSG)

Correct Answer: A

You can restrict traffic to multiple virtual networks in multiple subscriptions with a single Azure firewall.

Azure Firewall is a managed, cloud-based network security service that protects your Azure Virtual Network resources. It's a fully stateful firewall as a service with built-in high availability and unrestricted cloud scalability.

You can centrally create, enforce, and log application and network connectivity policies across subscriptions and virtual networks. Azure Firewall uses a static public IP address for your virtual network resources allowing outside firewalls to identify traffic originating from your virtual network.

References:

<https://docs.microsoft.com/en-us/azure/firewall/overview>

Community vote distribution

A (100%)

- Min_Thu**

Highly Voted

2 years, 6 months ago

The Azure Firewall service complements network security group functionality. Together, they provide better "defense-in-depth" network security. Network security groups provide distributed network layer traffic filtering to limit traffic to resources within virtual networks in each subscription. Azure Firewall is a fully stateful, centralized network firewall as-a-service, which provides network- and application-level protection across different subscriptions and virtual networks.

NSG can filter network within subscription and Azure firewall is across different subscription. So Ans is Azure Firewall

Question #221

Topic 1

Which Azure service should you use to store certificates?

- A. Azure Security Center
- B. an Azure Storage account
- C. Azure Key Vault
- D. Azure Information Protection

Correct Answer: C

Azure Key Vault is a secure store for storage various types of sensitive information including passwords and certificates. Azure Key Vault can be used to Securely store and tightly control access to tokens, passwords, certificates, API keys, and other secrets. Secrets and keys are safeguarded by Azure, using industry-standard algorithms, key lengths, and hardware security modules (HSMs). The HSMs used are Federal Information Processing Standards (FIPS) 140-2 Level 2 validated. Access to a key vault requires proper authentication and authorization before a caller (user or application) can get access. Authentication establishes the identity of the caller, while authorization determines the operations that they are allowed to perform.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
Azure Sentinel stores collected events in an Azure Storage account.	☐	☐
Azure Sentinel can remediate incidents automatically.	☐	☐
Azure Sentinel can collect Windows Defender Firewall logs from Azure virtual machines.	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
Azure Sentinel stores collected events in an Azure Storage account.	☒	☐
Azure Sentinel can remediate incidents automatically.	☒	☐
Azure Sentinel can collect Windows Defender Firewall logs from Azure virtual machines.	☒	☐

Reference:

<https://docs.microsoft.com/en-us/azure/sentinel/overview>

- wendyy

Highly Voted

2 years ago

I think the first should be NO. Azure Sentinel use Log Analytics workspace to stored log. After 90 days if Sentinel is enabled. Then you can export of logs from your Log Analytics workspace to destinations such as Azure Storage and Event Hub.

upvoted 28 times
- Fosnefes

7 months, 1 week ago

By default, logs ingested into Microsoft Sentinel are stored in Azure Monitor Log Analytics.

See - <https://learn.microsoft.com/en-us/azure/sentinel/store-logs-in-azure-data-explorer?tabs=adx-event-hub>

upvoted 1 times
- wendyy

2 years ago

More for this: Log Analytics workspace will keep your log inforatmion, after 90 days, you need pay money per G/month. If you want to use your storage account to store log, you need pay money to export log into your storage account or Event Hub. So first one is NO. storage account is only one option you can transfer log if you don't want pay money to keep. Log Analytics workspace is correct place.

upvoted 4 times
- Vincentvds

Sentinel Stores your events in a Log Analytics workspace and can retrieve events from a starage location. it doesnt store the events in a storage location.

upvoted 11 times
- Rajivjain

Most Recent

3 months, 1 week ago

YYY : Yes, Azure Sentinel can store collected events in an Azure Storage account. Azure Sentinel is a cloud-native security information and event management (SIEM) solution provided by Microsoft. It enables organizations to collect, analyze, and respond to security events and incidents across their environment.

Azure Sentinel can ingest data from various sources, including logs and events from Azure services, on-premises infrastructure, and third-party

systems. The collected events can be stored in an Azure Storage account, which provides a scalable and durable storage solution for the data. This allows organizations to retain and analyze security event data over a longer period of time, as required by their compliance or investigative needs.

upvoted 2 times

  **Ciupaz** 7 months ago

Microsoft Sentinel security analytics data is stored in an Azure Monitor Log Analytics workspace. Billing is based on the volume of that data in Microsoft Sentinel and the Azure Monitor Log Analytics workspace storage.

upvoted 2 times

  **mmatchev** 7 months, 3 weeks ago

No, Azure Sentinel does not store collected events in an Azure Storage account. Azure Sentinel stores events in a centralized Log Analytics workspace. The Log Analytics workspace acts as the data repository for Azure Sentinel and provides a single place for storing, analyzing, and querying security-related data from various sources.

upvoted 1 times

  **Contactfornitish** 1 year, 6 months ago

First answer is incorrect. As pointed out by others, Sentinel doesn't store content in storage account but in Log Analytics. Can say for sure since completed SC-200 few weeks back and SC-900 with 1000/1000 and one of the question was similar

upvoted 7 times

  **PreethiP** 1 year, 8 months ago

  **xian05** 2 years ago

Yes, Yes, Yes

upvoted 4 times

  **xian05** 2 years ago

Azure Sentinel stores collected events in an Azure Storage account:

This connector lets you stream your Azure Storage accounts' diagnostics logs into Azure Sentinel
The Azure Storage account connector is currently in PREVIEW
<https://docs.microsoft.com/en-us/azure/sentinel/connect-azure-storage-account>

Think this is Yes, even though it is in preview.

upvoted 2 times

  **GitGnomed** 2 years ago

I think you miss interpreted the question here. It states that Azure Sentinel stores its collected events in an Azure Storage account, and not that an Azure Storage account can send it's diagnostic logs to Azure Sentinel. Since Azure Sentinel uses a Log Analytics workspace to store its collected events and not an Azure Storage account, the answer to this question is no.

upvoted 2 times

  **xian05** 2 years ago

Azure Sentinel can collect Windows Defender Firewall Logs from Azure virtual machines.

The Windows Defender Firewall with Advanced Security connector allows Azure Sentinel to easily ingest Windows Defender Firewall with

Advanced Security logs from any Windows machines in your workspace.
<https://docs.microsoft.com/en-us/azure/sentinel/connect-windows-firewall>

So, Yes, with a connector you can collect these logs.

upvoted 1 times

  **xian05** 2 years ago

On second look, I notice the keyword 'can' with Q2 & Q3 and not with Q1.

Q1 Can only connect with a connector, so not by default.

Will change my answer to NYY.

upvoted 3 times

  **xian05** 2 years ago

Azure Sentinel can remediate incidents automatically:

Playbooks are collections of procedures that can be run from Azure Sentinel in response to an alert or incident. A playbook can help automate and orchestrate your response, and can be set to run automatically when specific alerts or incidents are generated, by being attached to an analytics rule or an automation rule, respectively.

<https://docs.microsoft.com/en-us/azure/sentinel/tutorial-respond-threats-playbook>

So, YES, after setting up rules, it should be able to remediate incidents auto.

upvoted 6 times

Question #224

Topic 1

DRAG DROP -

Match the Azure Services service to the correct descriptions.

Instructions: To answer, drag the appropriate service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.

NOTE: Each correct match is worth one point.

Select and Place:

Services	Answer Area
Azure Active Directory (Azure AD)	Analyze security log files from Azure virtual machines
Azure Key Vault	Display the secure score for an Azure subscription
Azure Lighthouse	Store passwords for use by Azure Function applications.
Azure Security Center	
Azure Sentinel	

Correct Answer: *Incorrect Answer:*

Box 1: Azure Sentinel -

Box 2: Azure Security Center -

Box 3: Azure Key Vault -

⇒ Azure Active Directory (Azure AD)

Azure AD is an identity and access management service, which helps your employees sign in and access resources

⇒ Azure Lighthouse

Azure Lighthouse is used for cross- and multi-tenant management.

Azure Firewall will encrypt all the network traffic sent from Azure to the Internet.

☐☐

A network security group (NSG) will encrypt all the network traffic sent from Azure to the Internet.

☐☐

Azure virtual machines that run Windows Server 2016 can encrypt network traffic sent to the Internet.

☐☐**Answer Area****Statements****Yes****No**

Azure Firewall will encrypt all the network traffic sent from Azure to the Internet.

☐☒

A network security group (NSG) will encrypt all the network traffic sent from Azure to the Internet.

☐☒

Azure virtual machines that run Windows Server 2016 can encrypt network traffic sent to the Internet.

☐☒

Correct Answer:

Box 1: No -

Azure firewall does not encrypt network traffic. It is used to block or allow traffic based on source/destination IP address, source/destination ports and protocol.

Box 2: No -

A network security group does not encrypt network traffic. It works in a similar way to a firewall in that it is used to block or allow traffic based on source/ destination IP address, source/destination ports and protocol.

Box 3: No -

The question is rather vague as it would depend on the configuration of the host on the Internet. Windows Server does come with a VPN client

and it also supports other encryption methods such IPsec encryption or SSL/TLS so it could encrypt the traffic if the Internet host was configured to require or accept the encryption.

However, the VM could not encrypt the traffic to an Internet host that is not configured to require the encryption.

Any (modern) web server installed on a Windows server 2016 could use TLS (or HTTPS bindings) - because that's how a good web server should be (and a common feature too).
upvoted 1 times

  **thebadfella** 2 years, 1 month ago

By default, any Windows doesn't encrypt outgoing/incoming traffic unless there's a VPN setup. So answer is correct "No"
upvoted 17 times

  **Hibin** 2 years ago

Windows CAN encrypt data, which is all that is being asked for.
In matters like this where the correct answer is ambiguous, I'm inclined to go with the one that makes Microsoft look good.
upvoted 17 times

  **alexandru_chirita** 1 year, 10 months ago

You don't need a VPN to encrypt traffic.
Install an SQL Server and configure TLS connections and you have encrypted traffic.
Install an IIS web server (in Windows features, anyone can have it) and configure HTTPS bindings and you have encrypted traffic. You can also deny HTTP traffic in IIS and allow only the HTTPS encrypted connections.
upvoted 4 times

  **wolfobi** 1 year, 8 months ago

You are correct except question is "Can encrypt data SENT to internet", so question is only about outbound data.
upvoted 4 times

  **lovecloud2** 1 year, 9 months ago

Yes captain obvious. Keyword is by default, it doesn't do that.
upvoted 3 times

  **ExamTopicsAdmin1** 1 year, 2 months ago

Umm actually, by default it does send data encrypted to the internet. What is going to be one of the first things you do when you stand up a VM? Go to the internet. Let's say you stood up the VM and decided to upload files to OneDrive using a browser. What protocol is that browser going to leverage? That's right SSL with some form of TLS encrypting the data. This should be yes.
upvoted 1 times

  **hercu**  2 years, 6 months ago

Box 3 is also "NO".
You cannot encrypt ALL kind of traffic from Azure VMs sent to the Internet!
You can only encrypt traffic between two TRUSTED endpoints. Obviously the Internet isn't the trusted endpoint. In order to make it work, the use of a VPN gateway is required, and then the traffic can be encrypted "over" the public connection - Internet, between Azure VMs/vNets and the trusted on-premises locations.

"You can use an Azure VPN gateway to send encrypted traffic between your virtual network and your on-premises location across a public connection, or to send traffic between virtual networks." References: <https://docs.microsoft.com/en-us/azure/security/fundamentals/encryption-overview>

upvoted 23 times

  **SimonR2** 2 years, 5 months ago

There is no VPN gateway required. This is simply asking about enrypting network traffic which pretty much every webserver in existance is able to do, whether its based on the internet or internal network communications.

The two endpoints don't necessarily have to trust each other. Its usually one-sided unless with the server needing to prove its trustworthy, unless there is client cert authentication too. All that needs to happen is that a server presents a public cert on the initial client connection and the client decides whether or not to trust the server during the TLS handshake. This depends on details on the cert such as the CA and available ciphers they agree upon.

Once the TLS handshake is completed and both sides have the the symmetric keys then the server begins encrypting data and sending it out over the network for the client to decrypt and vice versa.

Can an azure VM that runs windows server 2016 encrypt network traffic? The answer is definitely Yes, or microsoft would be going quickly out of business.

According to <https://azure.microsoft.com/en-us/products/azure-firewall/> it says ,
Azure Firewall decrypts outbound traffic, performs required security checks, and then encrypts the traffic to the destination.
It means that Azure Firewall does encryption for outbound traffic.

upvoted 1 times

  **Fosnefes** 7 months, 1 week ago

No Azure Firewall doesn't encrypt or decrypt traffic inbound or outbound. If you are sending a traffic with HTTPS, how will Firewall know what is the destination as the hostname headers are encrypted. So it just decap the packet to find the Hostheader and then check that against the network and application rule and allow/deny the request.

Question #226

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
Azure Security Center can monitor Azure resources and on-premises resources.	☐	☐
All Azure Security Center features are free.	☐	☐
From Azure Security Center, you can download a Regulatory Compliance report.	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
Azure Security Center can monitor Azure resources and on-premises resources.	☒	☐
All Azure Security Center features are free.	☐	☒
From Azure Security Center, you can download a Regulatory Compliance report.	☒	☐

Box 1: Yes -

Azure Security Center is a unified infrastructure security management system that strengthens the security posture of your data centers, and provides advanced threat protection across your hybrid workloads in the cloud - whether they're in Azure or not - as well as on premises.

Box 2: No -

Only two features: Continuous assessment and security recommendations, and Azure secure score, are free.

Box 3: Yes -

The advanced monitoring capabilities in Security Center also let you track and manage compliance and governance over time. The overall compliance provides you with a measure of how much your subscriptions are compliant with policies associated with your workload.

Question #227

Topic 1

DRAG DROP -

You need to complete the defense-in-depth strategy used in a datacenter.

What should you do? To answer, drag the appropriate layers to the correct positions in the model. Each layer may be used once, more than once, or not at all.

You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Select and Place:

Layers

Perimeter

Application

Physical Security

Answer Area

The diagram shows a series of five nested rectangles representing layers of defense. From the outermost to the innermost, the layers are labeled: 'Layer' (top), 'Identity & Access', 'Layer', 'Network', 'Compute', 'Layer', and 'Data' (bottom). The 'Layer' labels are in dashed boxes, indicating they are to be placed by the user. The other labels are solid.

Correct Answer:

Layers

Perimeter

Application

Physical Security

Answer Area

The diagram shows the correct placement of the layers. The layers are nested rectangles. From the outermost to the innermost, the layers are labeled: 'Physical Security' (top), 'Identity & Access', 'Perimeter', 'Network', 'Compute', 'Application', and 'Data' (bottom). The 'Physical Security', 'Perimeter', and 'Application' labels are in dashed boxes, indicating they were the correct selections.

Defence in depth layers (from bottom to top):

- ☞ Data
- In almost all cases attackers are after data.
- Data can be in database, stored on disk inside VMs, on a SaaS application such as Office 365 or in cloud storage.
- Those storing and controlling access to data to ensures that it's properly secured
- Often regulatory requirements dictates controls & processes

- to ensure confidentiality, integrity, and availability.
- ☞ Application
 - Ensure applications are secure and free of vulnerabilities.
 - Store sensitive application secrets in a secure storage medium.
 - Make security a design requirement for all application development.
 - Integrate security into the application development life cycle.
- ☞ Compute
 - Secure access to virtual machines.
 - Implement endpoint protection and keep systems patched and current.
 - Malware, unpatched systems, and improperly secured systems open your environment to attacks.
- ☞ Networking
 - Limit communication between resources.
 - Deny by default.
 - Allow only what is required
 - Restrict inbound internet access and limit outbound, where appropriate.
 - Implement secure connectivity to on-premises networks.
- ☞ Perimeter
 - Use distributed denial of service (DDoS) protection to filter large-scale attacks before they can cause a denial of service for end users.
 - Use perimeter firewalls to identify and alert on malicious attacks against your network.
- ☞ Identity and access
 - Control access to infrastructure and change control.
 - Access granted is only what is needed
 - Use single sign-on and multi-factor authentication.
 - Audit events and changes.
- ☞ Physical security
 - Building security & controlling access to computing hardware.
 - First line of defense.

Azure Disk Encryption helps protect and safeguard your data to meet your organizational security and compliance commitments. It uses the BitLocker feature of Windows to provide volume encryption for the OS and data disks of Azure virtual machines (VMs), and is integrated with Azure Key Vault to help you control and manage the disk encryption keys and secrets.

upvoted 1 times
- Ciupaz

7 months ago

Most difficult question in entire test bank.

upvoted 1 times
- Bereket

8 months ago

Selected Answer: B

Azure Disk Encryption uses Azure Key Vault to manage the disk encryption keys and secrets. You must create an Azure Key Vault before you can encrypt an Azure virtual machine using Azure Disk Encryption. The Key Vault is used to store the encryption keys and secrets, and it provides a central location for managing and securing these keys. Once you have created the Key Vault, you can then enable disk encryption on the virtual machine and specify the Key Vault as the location for the encryption keys.

upvoted 1 times
- zelck**

8 months, 1 week ago

You can use IP addresses, service tags, and application security groups as sources for inbound security rules in a Network Security Group (NSG) in Azure. IP addresses can be specified as a single IP address, a range of addresses, or using CIDR notation. Service tags are predefined sets of Azure services that can be used as sources for security rules, such as "AzureCloud" or "AzureActiveDirectory". Application security groups allow you to group virtual machines together and use the group as a source for security rules.

- zelck

8 months, 1 week ago

"automatically respond to threats" is the answer.

<https://learn.microsoft.com/en-us/azure/sentinel/automate-responses-with-playbooks#what-is-a-playbook>

A playbook is a collection of these remediation actions that can be run from Microsoft Sentinel as a routine. A playbook can help automate and orchestrate your threat response; it can be run manually on-demand on entities (in preview - see below) and alerts, or set to run automatically in response to specific alerts or incidents, when triggered by an automation rule.

For example, if an account and machine are compromised, a playbook can isolate the machine from the network and block the account by the time the SOC team is notified of the incident.

Networking Layer - Is DDoS a layer 4?
Layer 3 and Layer 4 DDoS Attacks Layer 3 and Layer 4 DDoS attacks are types of volumetric DDoS attacks on a network infrastructure Layer 3 (network layer), and 4 (transport layer)
upvoted 1 times

  **Cloud_Ryder** 7 months, 3 weeks ago

Answer for this question is Network Layer

When deployed with a web application firewall (WAF), Azure DDoS Protection protects both at the network layer (Layer 3 and 4, offered by Azure DDoS Protection) and at the application layer (Layer 7, offered by a WAF). WAF offerings include Azure Application Gateway WAF SKU and third-party web application firewall offerings available in the Azure Marketplace.
upvoted 2 times

  **kazan** 8 months, 1 week ago

Not sure which one to select?
When deployed with a web application firewall (WAF), Azure DDoS Protection protects both at the network layer (Layer 3 and 4, offered by Azure DDoS Protection)
upvoted 1 times

  **azirila** 8 months, 1 week ago

answer is perimeter layer, see below
Perimeter

At this layer, it's important to:

Use DDoS protection to filter large-scale attacks before they can affect the availability of a system for users.
Use perimeter firewalls to identify and alert on malicious attacks against your network.
At the network perimeter, it's about protecting from network-based attacks against your resources. Identifying these attacks, eliminating their impact, and alerting you when they happen are important ways to keep your network secure.
upvoted 2 times

  **zelck** 8 months, 1 week ago

Same as question 246.

Question #233

Topic 1

You have an Azure Sentinel workspace.

You need to automate responses to threats detected by Azure Sentinel.

What should you use?

- A. adaptive network hardening in Azure Security Center
- B. Azure Service Health
- C. Azure Monitor workbooks
- D. adaptive application controls in Azure Security Center

Correct Answer: C

Community vote distribution

C (100%)

- kwldgseeker

Highly Voted

1 year, 5 months ago

Either the answer is playbooks (which is not a provided choice) or the question itself is wrong. Workbooks does not provide for automation. It is a visualization / reporting tool. If you still doubt, look up "automate responses to threats detected by Azure Sentinel." in Google and you will find "Playbooks" in the results and nowhere will you find "Workbooks". I really love the spirit and intent of the site and have respect fort the small team behind it. At the same time I have to question where these questions came from. There are far too many discrepancies, errors and omissions to justify the asking price (which I regrettably paid as I thought my membership was for all tests, not just the AZ-900!). Clean up the discrepancies, errors and omissions (and include more than just one test) and it will be worth the asking price.

upvoted 7 times
-  **Contactfornitish**

1 year, 6 months ago

Odd one out but I would disagree with answer. Workbooks are just dashboard and takes no action themselves.

Sentinel uses playbook against known situations but playbook uses two things among others Adaptive network hardening (to reduce attack surface) and Adaptive Application Control (to have a known safe application list & block application on suspicious behavior). Since the Application control needs advance work, I would say surface reduction would be first choice in case of any attack. Hence A

Question #234

Topic 1

DRAG DROP -

Match the Azure services benefits to the correct descriptions.

Instructions: To answer, drag the appropriate benefit from the column on the left to its description on the right. Each benefit may be used once, more than once, or not at all.

NOTE: Each correct match is worth one point.

Select and Place:

Services	Answer Area
Azure Active Directory (Azure AD)	
Azure Key Vault	Provide security information event management (SIEM) functionality
Azure Lighthouse	Display the secure score for an Azure subscription
Microsoft Defender for Cloud	Store passwords for use by Azure Function applications
Microsoft Sentinel	

Correct Answer:

Services	Answer Area
Azure Active Directory (Azure AD)	
Azure Key Vault	Microsoft SentinelProvide security information event management (SIEM) functionality
Azure Lighthouse	Microsoft Defender for CloudDisplay the secure score for an Azure subscription
Microsoft Defender for Cloud	Azure Key VaultStore passwords for use by Azure Function applications
Microsoft Sentinel	

Box 1: Microsoft Sentinel -

Microsoft Sentinel is a scalable, cloud-native, security information and event management (SIEM) and security orchestration, automation, and response (SOAR) solution. Microsoft Sentinel delivers intelligent security analytics and threat intelligence across the enterprise, providing a single solution for attack detection, threat visibility, proactive hunting, and threat response.

Box 2: Microsoft Defender for Cloud

You can find your overall secure score, as well as your score per subscription, through the Azure portal. Defender for Cloud displays your secure score prominently in the portal.

Box 3: Azure Key Vault -

A favored approach to store the credentials or keys in the Azure Key Vault as secrets and reference the secrets as environment variables in our Azure functions apps.

"collect of policy definitions" is the answer.

<https://learn.microsoft.com/en-us/azure/governance/policy/overview#initiative-definition>

An initiative definition is a collection of policy definitions that are tailored toward achieving a singular overarching goal. Initiative definitions simplify managing and assigning policy definitions. They simplify by grouping a set of policies as one single item. For example, you could create an initiative titled Enable Monitoring in Microsoft Defender for Cloud, with a goal to monitor all the available security recommendations in your Microsoft Defender for Cloud instance.
upvoted 1 times

  **zelck** 8 months, 1 week ago

<https://learn.microsoft.com/en-us/training/modules/describe-features-tools-azure-for-governance-compliance/3-describe-purpose-of-azure-policy>

An Azure Policy initiative is a way of grouping related policies together. The initiative definition contains all of the policy definitions to help track your compliance state for a larger goal.

For example, Azure Policy includes an initiative named Enable Monitoring in Azure Security Center. Its goal is to monitor all available security recommendations for all Azure resource types in Azure Security Center.

Question #240

Topic 1

You need to collect and automatically analyze security events from Azure Active Directory (Azure AD).
What should you use?

- A. Microsoft Sentinel
- B. Azure Synapse Analytics
- C. Azure AD Connect
- D. Azure Key Vault

Correct Answer: A

Microsoft Sentinel is a scalable, cloud-native, security information and event management (SIEM) and security orchestration, automation, and response (SOAR) solution.

Microsoft Sentinel delivers intelligent security analytics and threat intelligence across the enterprise, providing a single solution for attack detection, threat visibility, proactive hunting, and threat response.

Azure AD

upvoted 2 times
- 👤

zelck

8 months, 2 weeks ago

"Azure AD" is the answer.

<https://learn.microsoft.com/en-us/training/modules/describe-azure-identity-access-security/2-directory-services>

Azure AD provides services such as:

- Single sign-on: Single sign-on (SSO) enables you to remember only one username and one password to access multiple applications. A single identity is tied to a user, which simplifies the security model. As users change roles or leave an organization, access modifications are tied to that identity, which greatly reduces the effort needed to change or disable accounts.

Question #242

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
A network security group (NSG) will block all network traffic by default.	☐	☐
Application security groups can be specified as part of network security group (NSG) rules.	☐	☐
Network security groups (NSGs) always include inbound security rules and outbound security rules.	☐	☐

Answer Area

	Statements	Yes	No
Correct Answer:	A network security group (NSG) will block all network traffic by default.	☐	☒
	Application security groups can be specified as part of network security group (NSG) rules.	☒	☐
	Network security groups (NSGs) always include inbound security rules and outbound security rules.	☒	☐

Box 1: No -

Azure creates the default rules in each network security group that you create. These rules allow some traffic.

Box 2: Yes -

A network security group contains zero, or as many rules as desired. These rules can refer to application security groups.

Box 3: Yes -

Azure creates the Inbound and OutBound default rules in each network security group that you create.

keyword: by default!!! its NYY

upvoted 1 times

  **speedyweedy** 4 months, 3 weeks ago

Answer is YYY

Network Security Group (NSG) in Azure will block all network traffic by default.

When you create a new NSG, there are no inbound or outbound security rules defined. This means that all inbound and outbound traffic to/from resources associated with the NSG is blocked.

To allow traffic to flow, you need to create inbound and/or outbound security rules explicitly in the NSG. These rules define the type of traffic (such as TCP or UDP), the source and destination IP addresses and ports, and the action (allow or deny).

It's important to note that NSGs are applied to subnets or network interfaces, not individual virtual machines. This means that all virtual machines associated with a subnet or network interface will be subject to the same NSG rules.

Also, keep in mind that NSGs are stateful, which means that if you create an inbound security rule to allow traffic, the return traffic will be allowed automatically. You don't need to create a separate outbound security rule to allow the return traffic.

upvoted 2 times

  **speedyweedy** 4 months, 3 weeks ago

Answer is YYY

NSG does block all traffic by default

upvoted 2 times

  **motekim** 7 months, 1 week ago

Take my test tomorrow. If i get this question, I'm going to go with NO:

By default, a Network Security Group (NSG) in Azure does not block all network traffic. It allows all inbound and outbound traffic until rules are added explicitly to block or allow traffic. When a new NSG is created, it has no rules, and therefore no traffic is blocked. It's up to the user to add rules to the NSG to allow or deny traffic.

upvoted 1 times

  **zelck** 8 months, 2 weeks ago

NYY is the answer.

<https://learn.microsoft.com/en-us/azure/virtual-network/network-security-groups-overview#default-security-rules>

<https://learn.microsoft.com/en-us/azure/virtual-network/network-security-groups-overview#application-security-groups>

Application security groups enable you to configure network security as a natural extension of an application's structure, allowing you to group virtual machines and define network security policies based on those groups. You can reuse your security policy at scale without manual maintenance of explicit IP addresses.

Unless you've created a rule that allows port 80 inbound, the traffic is denied by the DenyAllInbound default security rule, and never evaluated by NSG2, since NSG2 is associated to the network interface. If NSG1 has a security rule that allows port 80, the traffic is then processed by NSG2. To allow port 80 to the virtual machine, both NSG1 and NSG2 must have a rule that allows port 80 from the internet.

3. MFA
upvoted 3 times

  **zelck** 8 months, 2 weeks ago

<https://learn.microsoft.com/en-us/training/modules/describe-azure-identity-access-security/3-authentication-methods>

Single sign-on (SSO) enables a user to sign in one time and use that credential to access multiple resources and applications from different providers. For SSO to work, the different applications and providers must trust the initial authenticator.

Multifactor authentication is the process of prompting a user for an extra form (or factor) of identification during the sign-in process. MFA helps protect against a password compromise in situations where the password was compromised but the second factor wasn't.

Question #244

Topic 1

Your company plans to automate the deployment of servers to Azure.

Your manager is concerned that you may expose administrative credentials during the deployment.

You need to recommend an Azure solution that encrypts the administrative credentials during the deployment.

What should you include in the recommendation?

- A. Azure Key Vault
- B. Azure Information Protection
- C. Microsoft Defender for Cloud
- D. Azure Multi-Factor Authentication (MFA)

Correct Answer: A

Azure Key Vault protects cryptographic keys, certificates (and the private keys associated with the certificates), and secrets (such as connection strings and passwords) in the cloud.

Reference:

<https://docs.microsoft.com/en-us/azure/key-vault/general/security-features>

the correct answer is for sure "Perimeter layer"

upvoted 1 times
- XtraWest** 7 months, 2 weeks ago

as per Chat GPT: Azure DDoS protection is implemented at the network layer (layer 3 and 4) of the OSI (Open Systems Interconnection) model. This type of protection specifically targets Distributed Denial of Service (DDoS) attacks, which can congest a network or server with a high volume of incoming traffic from multiple sources, making it unavailable to legitimate users. Azure's DDoS protection service monitors network traffic and blocks malicious traffic before it reaches the target network, ensuring that the availability of the network and the resources hosted on it are protected against DDoS attacks.

Question #247

Topic 1

HOTSPOT -

Select the answer that correctly completes the sentence.

Hot Area:

Answer Area

Microsoft Sentinel uses playbooks to

automatically respond to threats

visualize data collected by connectors

specify how long data is retained

store passwords and certificates

Answer Area

Correct Answer:

Microsoft Sentinel uses playbooks to

automatically respond to threats

visualize data collected by connectors

specify how long data is retained

store passwords and certificates

Box: automatically respond to threats

Playbooks are collections of procedures that can be run from Microsoft Sentinel in response to an alert or incident. A playbook can help automate and orchestrate your response, and can be set to run automatically when specific alerts or incidents are generated, by being attached to an analytics rule or an automation rule, respectively.

Note: Automation rules help you triage incidents in Microsoft Sentinel. You can use them to automatically assign incidents to the right personnel, close noisy incidents or known false positives, change their severity, and add tags. They are also the mechanism by which you can run playbooks in response to incidents.

Reference:

<https://docs.microsoft.com/en-us/azure/sentinel/tutorial-respond-threats-playbook>

- zelck

8 months, 2 weeks ago

"automatically respond to threats" is the answer.

<https://learn.microsoft.com/en-us/azure/sentinel/automate-responses-with-playbooks#what-is-a-playbook>

A playbook is a collection of these remediation actions that can be run from Microsoft Sentinel as a routine. A playbook can help automate and orchestrate your threat response; it can be run manually on-demand on entities (in preview - see below) and alerts, or set to run automatically in response to specific alerts or incidents, when triggered by an automation rule.

For example, if an account and machine are compromised, a playbook can isolate the machine from the network and block the account by the time the SOC team is notified of the incident.

Question #248

Topic 1

You need to configure an Azure solution that meets the following requirements:

- Secures websites from attacks
- Generates reports that contain details of attempted attacks

What should you include in the solution?

- A. Azure Firewall
- B. a network security group (NSG)
- C. Azure Information Protection
- D. DDoS protection

Correct Answer: D

DDoS is a type of attack that tries to exhaust application resources. The goal is to affect the application's availability and its ability to handle legitimate requests.

DDoS attacks can be targeted at any endpoint that is publicly reachable through the internet.

Azure has two DDoS service offerings that provide protection from network attacks: DDoS Protection Basic and DDoS Protection Standard. DDoS Basic protection is integrated into the Azure platform by default and at no extra cost.

You have the option of paying for DDoS Standard. It has several advantages over the basic service, including logging, alerting, and telemetry. DDoS Standard can generate reports that contain details of attempted attacks as required in this question.

The correct answer is D. As per the following link "<https://docs.microsoft.com/en-us/azure/ddos-protection/ddos-protection-overview>", we can see that the chart states that DDoS supports 'Mitigation reports'. Furthermore, for those we do not know the definition of DDoS, the first line of this link states: 'A DDoS attack attempts to exhaust an application's resources, making the application unavailable to legitimate users.'

Question #249

Topic 1

HOTSPOT -

You plan to implement several security services for an Azure environment. You need to identify which Azure services must be used to meet the following security requirements:

- ☞ Monitor threats by using sensors
- ☞ Enforce Azure Multi-Factor Authentication (MFA) based on a condition

Which Azure service should you identify for each requirement? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Monitor threats by using sensors:

Azure Monitor
Azure Security Center
Azure Active Directory (Azure AD) Identity Protection
Azure Advanced Threat Protection (ATP)

Enforce Azure MFA based on a condition:

Azure Monitor
Azure Security Center
Azure Active Directory (Azure AD) Identity Protection
Azure Advanced Threat Protection (ATP)

Correct Answer:

Answer Area

Monitor threats by using sensors:

Azure Monitor
Azure Security Center
Azure Active Directory (Azure AD) Identity Protection
Azure Advanced Threat Protection (ATP)

Enforce Azure MFA based on a condition:

Azure Monitor
Azure Security Center
Azure Active Directory (Azure AD) Identity Protection
Azure Advanced Threat Protection (ATP)

Box 1:

To monitor threats by using sensors, you would use Azure Advanced Threat Protection (ATP).

Azure Advanced Threat Protection (ATP) is a cloud-based security solution that leverages your on-premises Active Directory signals to identify, detect, and investigate advanced threats, compromised identities, and malicious insider actions directed at your organization.

Sensors are software packages you install on your servers to upload information to Azure ATP.

Box 2:

To enforce MFA based on a condition, you would use Azure Active Directory Identity Protection.

Azure AD Identity Protection helps you manage the roll-out of Azure Multi-Factor Authentication (MFA) registration by configuring a Conditional Access policy to require MFA registration no matter what modern authentication app you are signing in to.

References:

<https://docs.microsoft.com/en-us/azure-advanced-threat-protection/what-is-atp> <https://docs.microsoft.com/en-us/azure/active-directory/identity-protection/howto-identity-protection-configure-mfa-policy>

"Azure ATP" and "Azure AD Identity Protection" is the answer.

<https://learn.microsoft.com/en-us/defender-for-identity/what-is>
Microsoft Defender for Identity (formerly Azure Advanced Threat Protection, also known as Azure ATP) is a cloud-based security solution that leverages your on-premises Active Directory signals to identify, detect, and investigate advanced threats, compromised identities, and malicious insider actions directed at your organization.

<https://learn.microsoft.com/en-us/azure/active-directory/identity-protection/concept-identity-protection-policies#azure-ad-mfa-registration-policy>
Identity Protection can help organizations roll out Azure AD multifactor authentication (MFA) using a policy requiring registration at sign-in. Enabling this policy is a great way to ensure new users in your organization have registered for MFA on their first day. Multifactor authentication is one of the self-remediation methods for risk events within Identity Protection. Self-remediation allows your users to take action on their own to reduce helpdesk call volume.

Question #250

Topic 1

Your Azure environment contains multiple Azure virtual machines.

You need to ensure that a virtual machine named VM1 is accessible from the Internet over HTTP.

What are two possible solutions? Each correct answer presents a complete solution.

NOTE: Each correct selection is worth one point.

- A. Modify an Azure Traffic Manager profile
- B. Modify a network security group (NSG)
- C. Modify a DDoS protection plan
- D. Modify an Azure firewall

Correct Answer: B

A network security group works like a firewall. You can attach a network security group to a virtual network and/or individual subnets within the virtual network.

You can also attach a network security group to a network interface assigned to a virtual machine. You can use multiple network security groups within a virtual network to restrict traffic between resources such as virtual machines and subnets.

You can filter network traffic to and from Azure resources in an Azure virtual network with a network security group. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources.

In this question, we need to add a rule to the network security group to allow the connection to the virtual machine on port 80 (HTTP).

- MANANDAVEY

Most Recent

2 months ago

Selected Answer: B

B. Modify a network security group (NSG)

D. Modify an Azure firewall

Explanation:

To ensure that a virtual machine named VM1 is accessible from the Internet over HTTP, you can use the following two solutions:

B. Modify a network security group (NSG): An NSG is a fundamental Azure resource that allows or denies network traffic to and from Azure resources, such as virtual machines. By default, incoming traffic to a virtual machine is blocked. To allow incoming HTTP traffic (port 80), you need to create an NSG rule that permits inbound traffic on port 80 for the specific virtual machine (VM1).

D. Modify an Azure firewall: Azure Firewall is a cloud-based network security service that provides stateful firewall capabilities. If you are using Azure Firewall to protect your virtual network, you need to create a rule that allows HTTP traffic (port 80) from the Internet to the specific virtual machine (VM1).

12 months ago

Perimeter layer. Please someone change the answer.

upvoted 36 times
- femzy

10 months, 1 week ago

should be layer and 3 or/and 4. For protection at layer 7, you will need a WAF. Networking layer for me.

upvoted 4 times
- Hash__

4 weeks, 1 day ago

Question is not about OSI model, but the azure layers. Confusing, I know.

upvoted 1 times
- Yiii

10 months ago

DDoS can protect layer 3 and/or 4 with WAF and and layer 7 offered by WAF, 'with WAF' is the condition for DDoS Protection on these layers. With perimeter layer protection, there is no such condition required, the DDoS be classed as one feature in the same category as perimeter layer, so for just answer this question, perimeter layer is correct.

 **Nabeeel** 7 months ago

the correct answer is for sure "Perimeter layer"

upvoted 1 times
- 

 **XtraWest** 7 months, 2 weeks ago

as per Chat GPT: Azure DDoS protection is implemented at the network layer (layer 3 and 4) of the OSI (Open Systems Interconnection) model. This type of protection specifically targets Distributed Denial of Service (DDoS) attacks, which can congest a network or server with a high volume of incoming traffic from multiple sources, making it unavailable to legitimate users. Azure's DDoS protection service monitors network traffic and blocks malicious traffic before it reaches the target network, ensuring that the availability of the network and the resources hosted on it are protected against DDoS attacks.

 **pabaumans** 8 months, 1 week ago

PErimeter layer as well as my first choice

upvoted 1 times
- 

 **zellck** 8 months, 2 weeks ago

"perimeter layer" is the answer.

<https://learn.microsoft.com/en-us/training/modules/describe-azure-identity-access-security/8-describe-defense-depth>
The network perimeter protects from network-based attacks against your resources. Identifying these attacks, eliminating their impact, and alerting you when they happen are important ways to keep your network secure.

At this layer, it's important to:

Use DDoS protection to filter large-scale attacks before they can affect the availability of a system for users.
Use perimeter firewalls to identify and alert on malicious attacks against your network.

upvoted 2 times
- 

 **RougePotatoe** 8 months, 2 weeks ago

This is a question about defense in depth. While in the networking work we consider DDoS protection to be a form of network protection atleast here on azure they consider it to be a "perimeter layer"

upvoted 1 times

  **RougePotatoe** 8 months, 1 week ago

I actually found conflicting information based on Microsoft's own documentation.

The perimeter layer uses distributed denial of service (DDoS) protection to filter large-scale attacks before they can cause a denial of service for users.

DDoS protection at the network (layer 3) layer. Azure provides additional protection for services provisioned in a virtual network.

upvoted 1 times

  **dolly79** 9 months, 3 weeks ago

Correct answer is Perimeter layer

Question #247

Topic 1

HOTSPOT -

Select the answer that correctly completes the sentence.

Hot Area:

Answer Area

Microsoft Sentinel uses playbooks to

automatically respond to threats

visualize data collected by connectors

specify how long data is retained

store passwords and certificates

Answer Area

Correct Answer: Microsoft Sentinel uses playbooks to

automatically respond to threats

visualize data collected by connectors

specify how long data is retained

store passwords and certificates

Box: automatically respond to threats

Playbooks are collections of procedures that can be run from Microsoft Sentinel in response to an alert or incident. A playbook can help automate and orchestrate your response, and can be set to run automatically when specific alerts or incidents are generated, by being attached to an analytics rule or an automation rule, respectively.

Note: Automation rules help you triage incidents in Microsoft Sentinel. You can use them to automatically assign incidents to the right personnel, close noisy incidents or known false positives, change their severity, and add tags. They are also the mechanism by which you can run playbooks in response to incidents.

Reference:

<https://docs.microsoft.com/en-us/azure/sentinel/tutorial-respond-threats-playbook>

- zelck

8 months, 2 weeks ago

"automatically respond to threats" is the answer.

<https://learn.microsoft.com/en-us/azure/sentinel/automate-responses-with-playbooks#what-is-a-playbook>
A playbook is a collection of these remediation actions that can be run from Microsoft Sentinel as a routine. A playbook can help automate and orchestrate your threat response; it can be run manually on-demand on entities (in preview - see below) and alerts, or set to run automatically in response to specific alerts or incidents, when triggered by an automation rule.

For example, if an account and machine are compromised, a playbook can isolate the machine from the network and block the account by the time the SOC team is notified of the incident.

Question #248

Topic 1

You need to configure an Azure solution that meets the following requirements:

- Secures websites from attacks
- Generates reports that contain details of attempted attacks

What should you include in the solution?

- A. Azure Firewall
- B. a network security group (NSG)
- C. Azure Information Protection
- D. DDoS protection

Correct Answer: D

DDoS is a type of attack that tries to exhaust application resources. The goal is to affect the application's availability and its ability to handle legitimate requests.

DDoS attacks can be targeted at any endpoint that is publicly reachable through the internet.

Azure has two DDoS service offerings that provide protection from network attacks: DDoS Protection Basic and DDoS Protection Standard. DDoS Basic protection is integrated into the Azure platform by default and at no extra cost.

You have the option of paying for DDoS Standard. It has several advantages over the basic service, including logging, alerting, and telemetry. DDoS Standard can generate reports that contain details of attempted attacks as required in this question.

Answer Area

Monitor threats by using sensors:

Azure Monitor
Azure Security Center
Azure Active Directory (Azure AD) Identity Protection
Azure Advanced Threat Protection (ATP)

Enforce Azure MFA based on a condition:

Azure Monitor
Azure Security Center
Azure Active Directory (Azure AD) Identity Protection
Azure Advanced Threat Protection (ATP)

Correct Answer:**Answer Area**

Monitor threats by using sensors:

Azure Monitor
Azure Security Center
Azure Active Directory (Azure AD) Identity Protection
Azure Advanced Threat Protection (ATP)

Enforce Azure MFA based on a condition:

Azure Monitor
Azure Security Center
Azure Active Directory (Azure AD) Identity Protection
Azure Advanced Threat Protection (ATP)

Box 1:

To monitor threats by using sensors, you would use Azure Advanced Threat Protection (ATP).

Azure Advanced Threat Protection (ATP) is a cloud-based security solution that leverages your on-premises Active Directory signals to identify, detect, and investigate advanced threats, compromised identities, and malicious insider actions directed at your organization.

Sensors are software packages you install on your servers to upload information to Azure ATP.

Box 2:

To enforce MFA based on a condition, you would use Azure Active Directory Identity Protection.

Azure AD Identity Protection helps you manage the roll-out of Azure Multi-Factor Authentication (MFA) registration by configuring a Conditional Access policy to require MFA registration no matter what modern authentication app you are signing in to.

References:

<https://docs.microsoft.com/en-us/azure-advanced-threat-protection/what-is-atp> <https://docs.microsoft.com/en-us/azure/active-directory/identity-protection/howto-identity-protection-configure-mfa-policy>

"Azure ATP" and "Azure AD Identity Protection" is the answer.

<https://learn.microsoft.com/en-us/defender-for-identity/what-is>
Microsoft Defender for Identity (formerly Azure Advanced Threat Protection, also known as Azure ATP) is a cloud-based security solution that leverages your on-premises Active Directory signals to identify, detect, and investigate advanced threats, compromised identities, and malicious insider actions directed at your organization.

<https://learn.microsoft.com/en-us/azure/active-directory/identity-protection/concept-identity-protection-policies#azure-ad-mfa-registration-policy>
Identity Protection can help organizations roll out Azure AD multifactor authentication (MFA) using a policy requiring registration at sign-in. Enabling this policy is a great way to ensure new users in your organization have registered for MFA on their first day. Multifactor authentication is one of the self-remediation methods for risk events within Identity Protection. Self-remediation allows your users to take action on their own to reduce helpdesk call volume.

Question #250

Topic 1

Your Azure environment contains multiple Azure virtual machines.

You need to ensure that a virtual machine named VM1 is accessible from the Internet over HTTP.

What are two possible solutions? Each correct answer presents a complete solution.

NOTE: Each correct selection is worth one point.

- A. Modify an Azure Traffic Manager profile
- B. Modify a network security group (NSG)
- C. Modify a DDoS protection plan
- D. Modify an Azure firewall

Correct Answer: B

A network security group works like a firewall. You can attach a network security group to a virtual network and/or individual subnets within the virtual network.

You can also attach a network security group to a network interface assigned to a virtual machine. You can use multiple network security groups within a virtual network to restrict traffic between resources such as virtual machines and subnets.

You can filter network traffic to and from Azure resources in an Azure virtual network with a network security group. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources. In this question, we need to add a rule to the network security group to allow the connection to the virtual machine on port 80 (HTTP).

Most Recent

2 months ago

Selected Answer: B

B. Modify a network security group (NSG)
D. Modify an Azure firewall

Explanation:

To ensure that a virtual machine named VM1 is accessible from the Internet over HTTP, you can use the following two solutions:

B. Modify a network security group (NSG): An NSG is a fundamental Azure resource that allows or denies network traffic to and from Azure resources, such as virtual machines. By default, incoming traffic to a virtual machine is blocked. To allow incoming HTTP traffic (port 80), you need to create an NSG rule that permits inbound traffic on port 80 for the specific virtual machine (VM1).

D. Modify an Azure firewall: Azure Firewall is a cloud-based network security service that provides stateful firewall capabilities. If you are using Azure Firewall to protect your virtual network, you need to create a rule that allows HTTP traffic (port 80) from the Internet to the specific virtual machine (VM1).

You can enable just in time (JIT) VM access by using

Azure Bastion

Azure Firewall

Azure Front Door

Azure Security Center

Answer Area

Correct Answer:

You can enable just in time (JIT) VM access by using

Azure Bastion

Azure Firewall

Azure Front Door

Azure Security Center

The just-in-time (JIT) virtual machine (VM) access feature in Azure Security Center allows you to lock down inbound traffic to your Azure Virtual Machines. This reduces exposure to attacks while providing easy access when you need to connect to a VM.

"Azure Security Center" is the answer, and it has been renamed to Microsoft Defender for Cloud.

<https://learn.microsoft.com/en-us/azure/defender-for-cloud/just-in-time-access-usage>

You can use Microsoft Defender for Cloud's just-in-time (JIT) access to protect your Azure virtual machines (VMs) from unauthorized network access. Many times firewalls contain allow rules that leave your VMs vulnerable to attack. JIT lets you allow access to your VMs only when the access is needed, on the ports needed, and for the period of time needed.

  **[Removed]** 2 years, 3 months ago

The second option is NO

"You can associate zero, or one, network security group to each virtual network subnet and network interface in a virtual machine. The same network security group can be associated to as many subnets and network interfaces as you choose."

Source: <https://docs.microsoft.com/en-us/azure/virtual-network/network-security-group-how-it-works>

upvoted 4 times

  **VIP_G** 1 year, 6 months ago

Furthermore, I took the AWS exam which is similar concepts, and over there it is the same... you can create Security Groups (instance level) and NACL (subnet level) in a VPC. VPC is their version of VNET. both Security Groups and NACL act as firewalls much like NSG. So the 2nd point is NO. You cannot attach an NSG to VNET but you can protect the VNET via NSG by attaching it to NIC or Subnet.

upvoted 1 times

  **VIP_G** 1 year, 6 months ago

Thank you for posting this. It appears that yes you can filter traffic in/out of VNET but via subnet and NIC level with NSG. If you look at the source posted by @mentedis it states how it all works. The NSG is configured at subnet and NIC level.

upvoted 1 times

  **[Removed]**  2 years, 6 months ago

should be all Yes. You can use an Azure network security group to filter network traffic to and from Azure resources in an Azure virtual network. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources. For each rule, you can specify source and destination, port, and protocol.

upvoted 16 times

  **Fabian2222**  1 month, 4 weeks ago

Based on ChatGPT:

The Azure Native Virtual Network (VNet) does not support directly associating Network Security Groups (NSGs) with the entire VNet. However, you can associate NSGs with individual subnets within the VNet to control network traffic at the subnet level. This way, you can effectively apply NSGs to a Virtual Network indirectly by configuring NSGs for its subnets.

upvoted 1 times

  **speedyweedy** 4 months, 3 weeks ago

correct answer is YNY

Network Security Group (NSG) in Azure will block all network traffic by default.

When you create a new NSG, there are no inbound or outbound security rules defined. This means that all inbound and outbound traffic to/from resources associated with the NSG is blocked.

To allow traffic to flow, you need to create inbound and/or outbound security rules explicitly in the NSG. These rules define the type of traffic (such as TCP or UDP), the source and destination IP addresses and ports, and the action (allow or deny).

It's important to note that NSGs are applied to subnets or network interfaces, not individual virtual machines. This means that all virtual machines associated with a subnet or network interface will be subject to the same NSG rules.

Also, keep in mind that NSGs are stateful, which means that if you create an inbound security rule to allow traffic, the return traffic will be allowed automatically. You don't need to create a separate outbound security rule to allow the return traffic.

Question #253

Topic 1

You have an Azure environment that contains 10 virtual networks and 100 virtual machines.

You need to limit the amount of inbound traffic to all the Azure virtual networks.

What should you create?

- A. one application security group (ASG)
- B. 10 virtual network gateways
- C. 10 Azure ExpressRoute circuits
- D. one Azure firewall

Correct Answer: D

You can restrict traffic to multiple virtual networks with a single Azure firewall.

Azure Firewall is a managed, cloud-based network security service that protects your Azure Virtual Network resources. It's a fully stateful firewall as a service with built-in high availability and unrestricted cloud scalability.

You can centrally create, enforce, and log application and network connectivity policies across subscriptions and virtual networks. Azure Firewall uses a static public IP address for your virtual network resources allowing outside firewalls to identify traffic originating from your virtual network.

References:

<https://docs.microsoft.com/en-us/azure/firewall/overview>

Azure Firewall

upvoted 1 times

🗨️ 👤 **Sud10** 2 years, 9 months ago

A network security group enables you to filter network traffic to and from Azure resources within an Azure virtual network. You can think of NSGs like an internal firewall.

<https://docs.microsoft.com/en-us/learn/modules/secure-network-connectivity-azure/5-filter-traffic-network-security-groups>

D should be the correct answer

upvoted 3 times

Question #254

Topic 1

This question requires that you evaluate the underlined text to determine if it is correct.

Azure Key Vault is used to store secrets for Azure Active Directory (Azure AD) user accounts.

Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed`. If the statement is incorrect, select the answer choice that makes the statement correct.

- A. No change is needed
- B. Azure Active Directory (Azure AD) administrative accounts
- C. Personally Identifiable Information (PII)
- D. server applications

Correct Answer: D

Key Vault is designed to store configuration secrets for server apps. It's not intended for storing data belonging to your app's users, and it shouldn't be used in the client-side part of an app.

Reference:

<https://docs.microsoft.com/en-us/learn/modules/manage-secrets-with-azure-key-vault/2-what-is-key-vault> <https://docs.microsoft.com/en-us/azure/key-vault/key-vault-overview> <https://docs.microsoft.com/en-us/learn/modules/manage-secrets-with-azure-key-vault/>

I would go with "D". Server Applications.

upvoted 118 times
-   **MCLC2021** 2 years, 3 months ago

I think that underlined text in the phrase is: "...Azure Active Directory (Azure AD) user accounts."

so if you read the "Important" section in the link <https://docs.microsoft.com/en-us/learn/modules/manage-secrets-with-azure-key-vault/2-what-is-key-vault>

You can read: "Key Vault is designed to store configuration secrets for server apps."

upvoted 27 times
-   **SimonR2** 2 years, 5 months ago

Agreed, you can store connection strings within azure vault rather than within the app itself. This greatly improved security!

upvoted 2 times
-   **shashu07** 2 years, 10 months ago

Answer A, as per attached Microsoft Article

function that connects to an Azure Key Vault using Azure Active Directory authentication, and then uses a secret stored in the vault to query a remote service.

// Create a Key Vault client with an Active Directory authentication callback
var keyVault = new KeyVaultClient(async (string authority, string resource, string scope) => {
var authContext = new AuthenticationContext(authority);
var credential = new ClientCredential(adClientId, adKey);
var token = await authContext.AcquireTokenAsync(resource, credential);
return token.AccessToken;
});

Selected Answer: A
In Azure, you can use Azure Key Vault to store secrets for Azure Active Directory (Azure AD) user accounts. Azure Key Vault is a cloud-based service that provides a secure location to store and manage cryptographic keys, secrets, and certificates.

To use Azure Key Vault to store secrets for Azure AD user accounts, you can follow these high-level steps:

1. Create an Azure Key Vault instance.
2. Define access policies to control who can access the secrets in the vault.
3. Store the secrets for your Azure AD user accounts in the vault.
4. Integrate Azure Active Directory with Azure Key Vault to enable your applications to access the secrets securely.

By storing secrets for Azure AD user accounts in Azure Key Vault, you can help to ensure that sensitive information is protected and that only authorized users and applications have access to it.
upvoted 1 times

  **trysec** 6 months, 1 week ago
zure Key Vault can be used to store secrets and keys securely, but it is not specifically designed to store Azure AD user account secrets. Instead, Azure AD provides its own capability to store and manage user account secrets, such as passwords and certificates.

Azure AD provides a password management feature that allows users to reset their passwords and recover their accounts. Passwords are stored securely in Azure AD and can be protected with multi-factor authentication for added security.

In addition, Azure AD also provides a certificate management feature that allows you to store and manage digital certificates for your applications and services. Certificates can be used for secure communication and authentication between different components of your applications.

However, if you have other secrets or keys that you need to store securely, you can use Azure Key Vault to store and manage them. Azure Key Vault provides a centralized location for storing and managing cryptographic keys, certificates, and other secrets. It provides secure access to secrets using access policies and permissions, and supports auditing and logging to help you meet compliance requirements.

D is the answer.

<https://learn.microsoft.com/en-us/azure/key-vault/general/overview#why-use-azure-key-vault>
Centralizing storage of application secrets in Azure Key Vault allows you to control their distribution. Key Vault greatly reduces the chances that

secrets may be accidentally leaked. When application developers use Key Vault, they no longer need to store security information in their application. Not having to store security information in applications eliminates the need to make this information part of the code. For example, an application may need to connect to a database. Instead of storing the connection string in the app's code, you can store it securely in Key Vault.

Your applications can securely access the information they need by using URIs. These URIs allow the applications to retrieve specific versions of a secret. There's no need to write custom code to protect any of the secret information stored in Key Vault.

Question #255

Topic 1

Your company plans to automate the deployment of servers to Azure.

Your manager is concerned that you may expose administrative credentials during the deployment.

You need to recommend an Azure solution that encrypts the administrative credentials during the deployment.

What should you include in the recommendation?

- A. Azure Key Vault
- B. Azure Information Protection
- C. Azure Security Center
- D. Azure Multi-Factor Authentication (MFA)

Correct Answer: A

Azure Key Vault is a secure store for storage various types of sensitive information. In this question, we would store the administrative credentials in the Key Vault.

With this solution, there is no need to store the administrative credentials as plain text in the deployment scripts.

All information stored in the Key Vault is encrypted.

Azure Key Vault can be used to Securely store and tightly control access to tokens, passwords, certificates, API keys, and other secrets.

Secrets and keys are safeguarded by Azure, using industry-standard algorithms, key lengths, and hardware security modules (HSMs). The HSMs used are

Federal Information Processing Standards (FIPS) 140-2 Level 2 validated.

Access to a key vault requires proper authentication and authorization before a caller (user or application) can get access. Authentication establishes the identity of the caller, while authorization determines the operations that they are allowed to perform.

Question #256

Topic 1

You plan to deploy several Azure virtual machines.

You need to control the ports that devices on the Internet can use to access the virtual machines.

What should you use?

- A. a network security group (NSG)
- B. an Azure Active Directory (Azure AD) role
- C. an Azure Active Directory group
- D. an Azure key vault

Correct Answer: A

A network security group works like a firewall. You can attach a network security group to a virtual network and/or individual subnets within the virtual network.

You can also attach a network security group to a network interface assigned to a virtual machine. You can use multiple network security groups within a virtual network to restrict traffic between resources such as virtual machines and subnets.

You can filter network traffic to and from Azure resources in an Azure virtual network with a network security group. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources.

Question #257

Topic 1

HOTSPOT -

To complete the sentence, select the appropriate option in the answer area.

Hot Area:

Answer Area

After you create a virtual machine, you need to modify the

network security group (NSG)

virtual network gateway

virtual network

route table

to allow connections to TCP port 8080 on the virtual machine.

Correct Answer:

Answer Area

After you create a virtual machine, you need to modify the

network security group (NSG)

virtual network gateway

virtual network

route table

to allow connections to TCP port 8080 on the virtual machine.

When you create a virtual machine, the default setting is to create a Network Security Group attached to the network interface assigned to a virtual machine.

A network security group works like a firewall. You can attach a network security group to a virtual network and/or individual subnets within the virtual network.

You can also attach a network security group to a network interface assigned to a virtual machine. You can use multiple network security groups within a virtual network to restrict traffic between resources such as virtual machines and subnets.

You can filter network traffic to and from Azure resources in an Azure virtual network with a network security group. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources.

In this question, we need to add a rule to the network security group to allow the connection to the virtual machine on port 8080.

correct answer is YYY

Yes, in Azure, a resource group can have the Owner role assigned to multiple users. The Owner role is a built-in role in Azure that provides full access to all resources in a resource group, including the ability to create, modify, and delete resources.

When you assign the Owner role to a user or group, it grants them full access to all resources within the resource group. Multiple users or groups can be assigned the Owner role for a resource group, which allows for collaboration and delegation of responsibilities among different teams or individuals.

It's important to note that assigning the Owner role to multiple users or groups can increase the risk of accidental or intentional changes to resources within the resource group. Therefore, it's recommended to carefully consider the access needs of each user or group and assign roles accordingly to minimize the risk of unauthorized access or accidental changes.

upvoted 1 times

  **zellck** 8 months, 2 weeks ago

YYY is the answer.

upvoted 3 times

  **zellck** 8 months, 2 weeks ago

A resource group can have the owner role assigned to multiple users. The owner role provides full access to manage and make changes to the resources within the resource group, including the ability to assign roles to other users and manage access to the resources. So, it is possible to assign the owner role to multiple users, allowing them to manage and make changes to the resources within the resource group.

This can be useful in scenarios where multiple users need the ability to manage and make changes to the resources in the resource group. It allows you to share the management of the resource group and delegate access to different users or teams.

As a result, these questions will not appear in the review screen.

Your Azure environment contains multiple Azure virtual machines.

You need to ensure that a virtual machine named VM1 is accessible from the Internet over HTTP.

Solution: You modify a network security group (NSG).

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: A

A network security group works like a firewall. You can attach a network security group to a virtual network and/or individual subnets within the virtual network.

You can also attach a network security group to a network interface assigned to a virtual machine. You can use multiple network security groups within a virtual network to restrict traffic between resources such as virtual machines and subnets.

You can filter network traffic to and from Azure resources in an Azure virtual network with a network security group. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources. In this question, we need to add a rule to the network security group to allow the connection to the virtual machine on port 80 (HTTP).

A Network Security Group (NSG) is sufficient to allow the connection to the virtual machine on port 80 (HTTP) from the Internet. Public IP is part of network configuration. We should mainly focus on the functionality of the Network security groups.

For sure, you can allow the connection to the VM through port 80 using NSG. Tutorial from Microsoft that demonstrates the same case (with public IP) and NSG used (no firewall!):

<https://docs.microsoft.com/en-us/azure/virtual-network/tutorial-filter-network-traffic>

upvoted 13 times
-   **hercu** 2 years, 6 months ago

In addition, note: "Some question sets might have more than one correct solution" which means that the answer available here can be part of the correct solution. To conclude, to modify NSG is surely the required task to meet the expected solution.

upvoted 2 times
-   **RGP4d33** 2 years, 5 months ago

But you're assuming (incorrectly) there is a public IP: and there could not... so, answer must be NO (because is an incomplete solution)

upvoted 1 times
-   **TecKen313** 2 years, 5 months ago

You are wrong. The answer IS CORRECT

Other questions have punished making assumptions, like the ones about assuming PowerShell is already installed when running a command from a Linux machine.

upvoted 1 times

  **RGP4d33** 2 years, 5 months ago

But nowhere says there is a public IP ... what if is being accessed only though Bastion? We couldn't predict there is a public IP, so answer shall be NO.

upvoted 1 times

  **zelck** Most Recent 8 months, 2 weeks ago

Selected Answer: A

A is the answer.

A network security group (NSG) is a feature in Azure that allows you to control inbound and outbound network traffic to and from Azure resources. By modifying a NSG and configuring it to allow incoming traffic over HTTP (TCP port 80), you can ensure that a virtual machine named VM1 is accessible from the Internet over HTTP.

You can do this by creating a new Inbound security rule in the NSG that is associated with the virtual network interface of the VM1, specifying the source as "Internet" and destination as the IP address of the VM1.

This solution meets the goal because by allowing incoming traffic over HTTP, you ensure that VM1 is accessible from the Internet using HTTP protocol.

You can attach a network security group to a virtual network and/or individual subnets within the virtual network.

No. You can't attach a NSG to a Vnet, but only to subnets within the Vnets or NIC. Please update the answer as its misleading.

upvoted 1 times

  **MGegruis** 2 years, 2 months ago

It Should be No, as NGS is to filter traffic in-between the Azure VM & Firewall is for traffic from/to internet.

upvoted 1 times

-  **projectkamote** 2 years, 2 months ago

NSG or firewall can do this. Since, NSD is present from the options . I chose NSG.

upvoted 1 times
-  **mauchi** 2 years, 3 months ago

The statement is very vague... but generally yes, modifying NSG in order to allow that traffic would be correct

upvoted 3 times
-  **Tintin_06** 2 years, 3 months ago

why not modifying ASG instead ?

"Your Azure environment contains multiple Azure virtual machines."

NSG :
Rules are applied to all resources in the associated subnet.

ASG :
Rules are applied to all ASGs in the same virtual network.

Application security groups

Application security groups enable you to configure network security as a natural extension of an application's structure, allowing you to group virtual machines and define network security policies based on those groups. You can reuse your security policy at scale without manual maintenance of explicit IP addresses. To learn more, see Application security groups.

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

Your Azure environment contains multiple Azure virtual machines.

You need to ensure that a virtual machine named VM1 is accessible from the Internet over HTTP.

Solution: You modify a DDoS protection plan.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: B

DDoS is a form of attack on a network resource. A DDoS protection plan is used to protect against DDoS attacks; it does not provide connectivity to a virtual machine.

To ensure that a virtual machine named VM1 is accessible from the Internet over HTTP, you need to modify a network security group or Azure Firewall.

Community vote distribution

A (100%)

-   **foreverlearner**

Highly Voted

 3 years, 4 months ago

You can either modify a firewall or modify a NSG. For basic allow/deny traffic, NSG is enough. But the same can be achieved with Firewall as well. "The Azure Firewall service complements network security group functionality. Together, they provide better "defense-in-depth" network security. Network security groups provide distributed network layer traffic filtering to limit traffic to resources within virtual networks in each subscription. Azure Firewall is a fully stateful, centralized network firewall as-a-service, which provides network- and application-level protection across different subscriptions and virtual networks." <https://docs.microsoft.com/en-us/azure/firewall/firewall-faq>

upvoted 49 times
-   **lehoang15tuoi** 2 years, 9 months ago

Your logic is not clear. To put it simply, both Firewall and NSG can be used to block traffic. Think of them like 2 gates on the same walkway. You open one and close one, can you pass through both? The NSG default rule is blocking all inbound traffic, so if you don't do anything with it, it doesn't matter what you do with the firewall.

upvoted 13 times
-   **Mozbius_** 1 year, 9 months ago

EXACTLY my chain of thought. But then again... They didn't specify that a NSG has been set up (NSG's are not set by default when you create a vm...) so the only thing that could prevent a vm from communicating on port 80 is the firewall...

upvoted 2 times
-   **Chris0105** 2 years, 5 months ago

You are right. see as well question #133, so it must be firewall or NSG. I actually thought it was just NSG - seems I am wrong.

upvoted 3 times
-   **thebadfella** 2 years, 1 month ago

Guys, forget about the question for a moment and look at your on-prem infra, you need to whitelist in FW first for any legitimate inbound access. So answer is "YES"

<https://docs.microsoft.com/en-us/azure/firewall/firewall-faq#what-is-the-difference-between-network-security-groups-nsgs-and-azure-firewall>

What is the difference between Application Gateway WAF and Azure Firewall?

The Web Application Firewall (WAF) is a feature of Application Gateway that provides centralized inbound protection of your web applications from common exploits and vulnerabilities. Azure Firewall provides inbound protection for non-HTTP/S protocols (for example, RDP, SSH, FTP), outbound network-level protection for all ports and protocols, and application-level protection for outbound HTTP/S.

upvoted 14 times
-   **Marcal**

Most Recent

 4 months, 2 weeks ago

No, modifying an Azure firewall would not meet the goal of ensuring that a virtual machine named VM1 is accessible from the Internet over HTTP. To achieve this goal, you would need to configure the network security group (NSG) associated with VM1 to allow inbound traffic on port 80 (HTTP).

upvoted 1 times
-   **BengalTigers** 6 months, 2 weeks ago

B. No.

Modifying an Azure firewall alone will not ensure that a virtual machine named VM1 is accessible from the Internet over HTTP. Instead, you need to configure the network security group (NSG) associated with the VM1's network interface to allow inbound traffic on port 80 (HTTP) from the Internet. Additionally, you may also need to configure any applicable Azure load balancer, DNS, or public IP settings to ensure proper connectivity.

🗲️  **mikamozg** 1 year, 10 months ago

Firewall, WAF and NSG

Application rules aren't applied for inbound connections. So if you want to filter inbound HTTP/S traffic, you should use Web Application Firewall (WAF). Or alternatively you can tweak NSG because by default everything is closed on NSG once it is created and assigned to vnet, subnet or vnic. Below is tutorial how to setup firewall and vnet, but if you go through you will see that all conversation is about outbound traffic not inbound may be because Azure Firewall application rules aren't applied for inbound connections. So we left with WAF or NSG.

<https://docs.microsoft.com/en-us/azure/firewall/tutorial-firewall-deploy-portal>

upvoted 1 times

🗲️  **mikamozg** 1 year, 10 months ago

in addition if you go through the deploy guide you will see that making changes to firewall is not enough you always need to do additional things like create default route in ip tables or create default route in VM in order to direct traffic to firewall. so answering to test question making changes on Firewall is not enough.

upvoted 1 times

🗲️  **mikamozg** 1 year, 10 months ago

<https://docs.microsoft.com/en-us/azure/virtual-machines/windows/nsg-quickstart-portal>

You open a port, or create an endpoint, to a virtual machine (VM) in Azure by creating a network filter on a subnet or a VM network interface. You place these filters, which control both inbound and outbound traffic, on a network security group attached to the resource that receives the traffic.

🗨️ 👤 **rob_724** 2 years, 6 months ago

while modifying azure firewall 'can' help -- firewall is not a default service and it is not assumed that it has been already enabled.

upvoted 1 times

🗨️ 👤 **hercu** 2 years, 6 months ago

I think that the following quote resolves all doubts as it sounds clear enough. "The Web Application Firewall (WAF) is a feature of Application Gateway that provides centralized inbound protection of your web applications from common exploits and vulnerabilities. Azure Firewall provides inbound protection for non-HTTP/S protocols (for example, RDP, SSH, FTP), outbound network-level protection for all ports and protocols, and application-level protection for outbound HTTP/S." References: <https://docs.microsoft.com/en-us/azure/firewall/firewall-faq>

Comment: Azure firewall is not intended for inbound HTTP/S protection. This means that only the variant with "You modify a network security group (NSG)." in the other similar question is correct. Hope it helps :)

upvoted 4 times

🗨️ 👤 **Mozbius_** 1 year, 9 months ago

I would agree with you hercu but then Microsoft also says the following (can't be clearer than that) :

Can be filtered by Azure Firewall :

- * HTTP(S) traffic from on-premises/internet to Azure (inbound)
- * HTTP(S) traffic from Azure to on-premises/internet (outbound)
- * Non-HTTP(S) traffic, inbound/outbound

<https://docs.microsoft.com/en-us/azure/architecture/example-scenario/gateway/firewall-application-gateway>

upvoted 1 times

🗨️ 👤 **JohnBB** 2 years, 6 months ago

NO is the correct answer.

Explanation: <https://docs.microsoft.com/en-us/azure/firewall/firewall-faq#are-network-security-groups--nsgs--supported-on-the-azurefirewallsubnet>

Does Azure Firewall support inbound traffic filtering?

Inbound protection is typically used for non-HTTP/S protocols

Question #263

Topic 1

This question requires that you evaluate the underlined text to determine if it is correct.

Azure Germany can be used by legal residents of Germany only.

Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed`. If the statement is incorrect, select the answer choice that makes the statement correct.

- A. no change is needed
- B. only enterprises that are registered in Germany
- C. only enterprises that purchase their azure licenses from a partner based in Germany
- D. any user or enterprise that requires its data to reside in Germany

Correct Answer: D

Azure Germany is available to eligible customers and partners globally who intend to do business in the EU/EFTA, including the United Kingdom.

Azure Germany offers a separate instance of Microsoft Azure services from within German datacenters. The datacenters are in two locations, Frankfurt/Main and Magdeburg. This placement ensures that customer data remains in Germany and that the datacenters connect to each other through a private network. All customer data is exclusively stored in those datacenters. A designated German company--the German data trustee--controls access to customer data and the systems and infrastructure that hold customer data.

Azure Germany documentation

Azure Germany is a physically isolated instance of Microsoft Azure that uses world-class security and compliance services that are critical to German data privacy regulations. Since August 2018, we have not been accepting new customers or deploying any new features and services into the original Microsoft Cloud Germany locations. Based on the evolution in customers' needs, we recently launched two new datacenter regions in Germany, offering customer data residency, full connectivity to Microsoft's global cloud network, as well as market competitive pricing.

Question #264

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
Identities stored in an on-premises Active Directory can be synchronized to Azure Active Directory (Azure AD).	☐	☐
Identities stored in Azure Active Directory (Azure AD), third-party cloud services, and on-premises Active Directory can be used to access Azure resources.	☐	☐
Azure has built-in authentication and authorization services that provide secure access to Azure resources.	☐	☐

Answer Area

	Statements	Yes	No
Correct Answer:	Identities stored in an on-premises Active Directory can be synchronized to Azure Active Directory (Azure AD).	☒	☐
	Identities stored in Azure Active Directory (Azure AD), third-party cloud services, and on-premises Active Directory can be used to access Azure resources.	☒	☐
	Azure has built-in authentication and authorization services that provide secure access to Azure resources.	☒	☐

Box 1: Yes -

The tool you would use to sync the accounts is Azure AD Connect. The Azure Active Directory Connect synchronization services (Azure AD Connect sync) is a main component of Azure AD Connect. It takes care of all the operations that are related to synchronize identity data between your on-premises environment and Azure AD.

Box 2: Yes -

As described above, third-party cloud services and on-premises Active Directory can be used to access Azure resources. This is known as 'federation'.

Federation is a collection of domains that have established trust. The level of trust may vary, but typically includes authentication and almost always includes authorization. A typical federation might include a number of organizations that have established trust for shared access to a set of resources.

Box 3: Yes -

Azure Active Directory (Azure AD) is a centralized identity provider in the cloud. This is the primary built-in authentication and authorization service to provide secure access to Azure resources.

References:

<https://docs.microsoft.com/en-us/azure/active-directory/hybrid/how-to-connect-sync-what-is> <https://docs.microsoft.com/en-us/azure/active-directory/hybrid/what-is-fed> <https://docs.microsoft.com/en-us/azure/active-directory/develop/authentication-scenarios>

Azure Security Center renamed to Azure Defender for Cloud.

This is the answer.

upvoted 2 times

  **zellck** 8 months, 2 weeks ago

"Azure Security Center" is the answer. It has been renamed to Microsoft Defender for Cloud.

<https://learn.microsoft.com/en-us/azure/defender-for-cloud/defender-for-cloud-introduction#cspm---remediate-security-issues-and-watch-your-security-posture-improve>

As soon as you open Defender for Cloud for the first time, Defender for Cloud:

- Generates a secure score for your subscriptions based on an assessment of your connected resources compared with the guidance in Microsoft cloud security benchmark. Use the score to understand your security posture, and the compliance dashboard to review your compliance with the built-in benchmark. When you've enabled the enhanced security features, you can customize the standards used to assess your compliance, and add other regulations (such as NIST and Azure CIS) or organization-specific security requirements. You can also apply recommendations, and score based on the AWS Foundational Security Best practices standards.

Question #267

Topic 1

HOTSPOT -

To complete the sentence, select the appropriate option in the answer area.

Hot Area:

Answer Area

Your company implements

Azure policies

DDoS protection

Azure Information Protection

Azure Active Directory (Azure AD) Identity Protection

 to

automatically add a watermark to Microsoft Word documents that contain credit card information.

Correct Answer:

Answer Area

Your company implements

Azure policies

DDoS protection

Azure Information Protection

Azure Active Directory (Azure AD) Identity Protection

 to

automatically add a watermark to Microsoft Word documents that contain credit card information.

Azure Information Protection is used to automatically add a watermark to Microsoft Word documents that contain credit card information. You use Azure Information Protection labels to apply classification to documents and emails. When you do this, the classification is identifiable regardless of where the data is stored or with whom it's shared. The labels can include visual markings such as a header, footer, or watermark. Labels can be applied automatically by administrators who define rules and conditions, manually by users, or a combination where users are given recommendations. In this question, we would configure a label to be automatically applied to Microsoft Word documents that contain credit card information. The label would then add the watermark to the documents.

Question #268

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
Azure Active Directory (Azure AD) requires the implementation of domain controllers on Azure virtual machines.	☐	☐
Azure Active Directory (Azure AD) provides authentication services for resources hosted in Azure and Microsoft 365.	☐	☐
Each user account in Azure Active Directory (Azure AD) can be assigned only one license.	☐	☐

Answer Area

Statements

Yes

No

Azure Active Directory (Azure AD) requires the implementation of domain controllers on Azure virtual machines.

☐

☒

Azure Active Directory (Azure AD) provides authentication services for resources hosted in Azure and Microsoft 365.

☒

☐

Each user account in Azure Active Directory (Azure AD) can be assigned only one license.

☐

☒

Correct Answer:

Box 1: No -

Azure Active Directory (Azure AD) is a cloud-based service. It does not require domain controllers on virtual machines.

Box 2: Yes -

Azure Active Directory (Azure AD) is a centralized identity provider in the cloud. This is the primary built-in authentication and authorization service to provide secure access to Azure resources and Microsoft 365.

Box 3: No -

User accounts in Azure Active Directory can be assigned multiple licenses for different Azure or Microsoft 365 services.

NYN is the answer.

<https://learn.microsoft.com/en-us/azure/active-directory/enterprise-users/licensing-groups-resolve-problems#more-than-one-product-license-assigned-to-a-group>

You can assign more than one product license to a group. For example, you can assign Office 365 Enterprise E3 and Enterprise Mobility + Security to a group to easily enable all included services for users.

Azure AD attempts to assign all licenses that are specified in the group to each user. If Azure AD can't assign one of the products because of business logic problems, it won't assign the other licenses in the group either. An example is if there aren't enough licenses for all, or if there are conflicts with other services that are enabled on the user.

You can see the users who failed to get assigned and check which products are affected by this problem.

upvoted 1 times

  **kamal_004** 11 months ago

Answer: No Yes No

upvoted 2 times

  **raul4real73** 1 year, 3 months ago

2 is NO.

Azure AD helps users access both external and internal resources.

External resources might include Microsoft Office 365, the Azure portal, and thousands of other software as a service (SaaS) applications.

Internal resources might include apps on your corporate network and intranet, along with any cloud applications developed within your organization.

upvoted 1 times

  **kapy024** 1 year, 3 months ago

Your comment is exactly the response for YES.

If it is used for internal and external then it means correct. Microsoft 365 is external.

Question #269

Topic 1

Which two types of customers are eligible to use Azure Government to develop a cloud solution? Each correct answer presents a complete solution.

NOTE: Each correct selection is worth one point.

- A. a Canadian government contractor
- B. a European government contractor
- C. a United States government entity
- D. a United States government contractor
- E. a European government entity

Correct Answer: *CD*

Azure Government is a cloud environment specifically built to meet compliance and security requirements for US government. This mission-critical cloud delivers breakthrough innovation to U.S. government customers and their partners. Azure Government applies to government at any level æ" from state and local governments to federal agencies including Department of Defense agencies.

The key difference between Microsoft Azure and Microsoft Azure Government is that Azure Government is a sovereign cloud. It's a physically separated instance of Azure, dedicated to U.S. government workloads only. It's built exclusively for government agencies and their solution providers.

Question #270

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
To implement an Azure Multi-Factor Authentication (MFA) solution, you must sync on-premises identities to the cloud.	☐	☐
Two valid methods for Azure Multi-Factor Authentication (MFA) are picture identification and a passport number.	☐	☐
Azure Multi-Factor Authentication (MFA) can be required for administrative and non-administrative user accounts.	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
To implement an Azure Multi-Factor Authentication (MFA) solution, you must sync on-premises identities to the cloud.	☐	☒
Two valid methods for Azure Multi-Factor Authentication (MFA) are picture identification and a passport number.	☐	☒
Azure Multi-Factor Authentication (MFA) can be required for administrative and non-administrative user accounts.	☒	☐

Box 1: No -

It is not true that you must deploy a federation solution or sync on-premises identities to the cloud. You can have a cloud-only environment and use MFA.

Box 2: No -

Picture identification and passport numbers are not valid MFA authentication methods. Valid methods include: Password, Microsoft Authenticator App, SMS and Voice call.

Box 3:

You can configure MFA to be required for administrator accounts only or you can configure MFA for any user account.

<https://learn.microsoft.com/en-us/azure/active-directory/authentication/concept-mfa-howitworks#available-verification-methods>
The following additional forms of verification can be used with Azure AD Multi-Factor Authentication:
- Microsoft Authenticator app
- Windows Hello for Business
- FIDO2 security key
- OATH hardware token (preview)
- OATH software token
- SMS
- Voice call
upvoted 1 times

  **Pinha** 8 months, 2 weeks ago

NNY

If you have on-premises users that you want to use Azure MFA with, you have a few options:

Sync your on-premises identities to Azure AD using Azure AD Connect. This will allow you to manage your on-premises and cloud-based users in a single place and use Azure MFA with both types of users.

Use Azure AD Domain Services to provide your on-premises users with cloud-based authentication services. This will allow you to use Azure MFA with your on-premises users without the need to sync their identities to the cloud.

Use a third-party MFA solution that can integrate with your on-premises environment. This will allow you to use Azure MFA with your on-premises users without the need to sync their identities to the cloud.

In summary, it is not necessary to sync on-premises identities to the cloud in order to implement an Azure MFA solution, but it may be necessary if you want to use Azure MFA with on-premises users.

WTF!? If you have on-prem - you should sync AD, if you have no on-prem - the first question has no sense.

upvoted 5 times

🗨️ 👤 **hima_hk04** 1 year, 11 months ago

It is not a must to sync on-premises identities to the cloud, as we can use Azure Connect, where we need not sync on-premise identities to the cloud and also we can use MFA Server on the on-premise, where it communicates with the Azure MFA and in that case need not sync on-premise identities to azure

upvoted 4 times

🗨️ 👤 **tntbb** 1 year, 9 months ago

No. Prerequisites is to sync on-premise AD.

"Deploy Azure AD Connect and synchronize user identities between the on-premises Active Directory Domain Services (AD DS) and Azure AD"

Question #271

Topic 1

You need to ensure that when Azure Active Directory (Azure AD) users connect to Azure AD from the Internet by using an anonymous IP address, the users are prompted automatically to change their password.

Which Azure service should you use?

- A. Azure AD Connect Health
- B. Azure AD Privileged Identity Management
- C. Azure Advanced Threat Protection (ATP)
- D. Azure AD Identity Protection

Correct Answer: D

Azure AD Identity Protection includes two risk policies: sign-in risk policy and user risk policy. A sign-in risk represents the probability that a given authentication request isn't authorized by the identity owner.

There are several types of risk detection. One of them is Anonymous IP Address. This risk detection type indicates sign-ins from an anonymous IP address (for example, Tor browser or anonymous VPN). These IP addresses are typically used by actors who want to hide their login telemetry (IP address, location, device, etc.) for potentially malicious intent.

You can configure the sign-in risk policy to require that users change their password.

References:

<https://docs.microsoft.com/en-us/azure/active-directory/identity-protection/howto-sign-in-risk-policy> <https://docs.microsoft.com/en-us/azure/active-directory/identity-protection/concept-identity-protection-risks>

D is the answer.

<https://learn.microsoft.com/en-us/azure/active-directory/identity-protection/concept-identity-protection-user-experience#risky-user-self-remediation>

- The user is informed that their account security is at risk because of suspicious activity or leaked credentials.
 - The user is required to prove their identity by completing Azure AD MFA with one of their previously registered methods.
 - Finally, the user is forced to change their password using self-service password reset since someone else may have had access to their account.

upvoted 1 times
-   **zelck** 8 months, 2 weeks ago

Azure AD Identity Protection is a service that provides risk-based conditional access for Azure AD. It can be used to automatically prompt users to change their passwords when they connect to Azure AD from an anonymous IP address.

It is based on analyzing the user's sign-in activity and also enables you to set policies that can require users to change their passwords when sign-in from an anonymous IP address.

Question #272

Topic 1

DRAG DROP -

Match the term to the correct definition.

Instructions: To answer, drag the appropriate term from the column on the left to its description on the right. Each term may be used once, more than once, or not at all.

NOTE: Each correct match is worth one point.

Select and Place:

Answer Options**Answer Area**

Azure Government		An organization that defines international standards across all industries.
GDPR		An organization that defines standards used by the United States government.
ISO		A European policy that regulates data privacy and data protection.
NIST		A dedicated public cloud for federal and state agencies in the United States.

Correct Answer:

Answer Options**Answer Area**

Azure Government	ISO	An organization that defines international standards across all industries.
GDPR	NIST	An organization that defines standards used by the United States government.
ISO	GDPR	A European policy that regulates data privacy and data protection.
NIST	Azure Government	A dedicated public cloud for federal and state agencies in the United States.

Box 1: ISO -

ISO is the International Organization for Standardization. Companies can be certified to ISO standards, for example ISO 9001 or 27001 are commonly used in IT companies.

Box 2: NIST -

The National Institute of Standards and Technology (NIST) is a physical sciences laboratory, and a non-regulatory agency of the United States Department of Commerce.

Box 3: GDPR -

GDPR is the General Data Protection Regulations. This standard was adopted across Europe in May 2018 and replaces the now deprecated Data Protection Directive.

The General Data Protection Regulation (EU) (GDPR) is a regulation in EU law on data protection and privacy in the European Union (EU) and the European

Economic Area (EEA). It also addresses the transfer of personal data outside the EU and EEA areas. The GDPR aims primarily to give control to individuals over their personal data and to simplify the regulatory environment for international business by unifying the regulation within the EU.

Box 4: Azure Government -

US government agencies or their partners interested in cloud services that meet government security and compliance requirements, can be confident that

Microsoft Azure Government provides world-class security, protection, and compliance services. Azure Government delivers a dedicated cloud

enabling government agencies and their partners to transform mission-critical workloads to the cloud. Azure Government services handle data that is subject to certain government regulations and requirements, such as FedRAMP, NIST 800.171 (DIB), ITAR, IRS 1075, DoD L4, and CJIS. In order to provide you with the highest level of security and compliance, Azure Government uses physically isolated datacenters and networks (located in U.S. only).

I would say the answer is B because it is asking what an application should connect to retrieve a security token.

<https://learn.microsoft.com/en-us/azure/key-vault/general/overview>

Securely store secrets and keys

Access to a key vault requires proper authentication and authorization before a caller (user or application) can get access. Authentication establishes the identity of the caller, while authorization determines the operations that they're allowed to perform.

Authentication is done via Azure Active Directory.

Question #273

Topic 1

To what should an application connect to retrieve security tokens?

- A. an Azure Storage account
- B. Azure Active Directory (Azure AD)
- C. a certificate store
- D. an Azure key vault

Correct Answer: *D*

Key Vault is designed to store configuration secrets for server apps.

Incorrect Answers:

A: An Azure Storage account is used to store data. It is not used to store secrets for applications.

B: Azure Active Directory (Azure AD) is a centralized identity provider in the cloud that authenticates users and provides access tokens to them. It is not used for applications.

Reference:

<https://docs.microsoft.com/en-us/learn/modules/manage-secrets-with-azure-key-vault/2-what-is-key-vault> <https://docs.microsoft.com/en-us/azure/key-vault/key-vault-overview>

Community vote distribution

D (55%)

B (45%)

- zimzimzimma** 3 months, 2 weeks ago

Addendum to myself: See <https://learn.microsoft.com/en-us/azure/active-directory/develop/security-tokens>
It's definitely Azure AD.

upvoted 1 times
- speedyweedy** 4 months, 3 weeks ago

Selected Answer: B

An application should connect to the Azure Active Directory (Azure AD) authentication endpoint to retrieve security tokens.

Azure AD provides different authentication endpoints for different scenarios, but the most common endpoint used to retrieve security tokens is the OAuth 2.0 authorization endpoint. The endpoint URL is typically formatted as follows:

...
<https://login.microsoftonline.com/{tenant}/oauth2/v2.0/token>
...

Where `{tenant}` is the name or ID of the Azure AD tenant that the application is registered in.

To retrieve an access token from the OAuth 2.0 authorization endpoint, the application must first obtain an authorization code from the Azure AD authorization endpoint. The authorization code is obtained by redirecting the user to a sign-in page, where the user signs in with their Azure AD credentials and consents to the application's requested permissions.

upvoted 1 times

  **XtraWest** 7 months, 2 weeks ago

Selected Answer: B
GPT: In Azure, an application typically connects to Azure Active Directory (Azure AD) to retrieve security tokens. Azure AD is a cloud-based identity and access management (IAM) service that provides authentication and authorization for applications and users.
upvoted 2 times

  **MikeScout** 7 months, 2 weeks ago

For me it is b) as a security token is provided by an identity provider. When registering the application in Azure AD the security token handler/service is providing the token that is part of the Azure AD. That token is used to authenticate against the key vault. I think tokens should be dynamically created and key vault would provide a static one.
Link: <https://learn.microsoft.com/en-us/azure/active-directory/develop/security-tokens>
upvoted 1 times

  **ftkftk** 7 months, 2 weeks ago

Hello, is that topic on the exam now?
upvoted 1 times

  **Default624** 7 months, 2 weeks ago

Selected Answer: B
Security tokens are digital artifacts that are used to prove identity and grant access to resources. They typically contain information such as the identity of the user, the resource being accessed, and the permissions granted. Security tokens are used in authentication and authorization processes to ensure that only authorized users can access protected resources.

An application should connect to Azure AD to retrieve security tokens. Key Vault can be used to securely store and manage these tokens, but the application should first retrieve them from Azure AD.
upvoted 1 times

Question #274

Topic 1

Your network contains an Active Directory forest. The forest contains 5,000 user accounts.

Your company plans to migrate all network resources to Azure and to decommission the on-premises data center.

You need to recommend a solution to minimize the impact on users after the planned migration.

What should you recommend?

- A. Implement Azure Multi-Factor Authentication (MFA)
- B. Sync all the Active Directory user accounts to Azure Active Directory (Azure AD)
- C. Instruct all users to change their password
- D. Create a guest user account in Azure Active Directory (Azure AD) for each user

Correct Answer: B

To migrate to Azure and decommission the on-premises data center, you would need to create the 5,000 user accounts in Azure Active Directory. The easy way to do this is to sync all the Active Directory user accounts to Azure Active Directory (Azure AD). You can even sync their passwords to further minimize the impact on users.

The tool you would use to sync the accounts is Azure AD Connect. The Azure Active Directory Connect synchronization services (Azure AD Connect sync) is a main component of Azure AD Connect. It takes care of all the operations that are related to synchronize identity data between your on-premises environment and Azure AD.

References:

<https://docs.microsoft.com/en-us/azure/active-directory/hybrid/how-to-connect-sync-what-is>

Community vote distribution

- Ragijo

Highly Voted

3 years, 10 months ago

MFA is to use your phone or a secondary phase of authentication.

You need to move users to Azure not reset their passwords, so Instruct all users to change their password is invalid.

Create a guest user account in Azure Active Directory (Azure AD) for each user, if you do that, is like creating a new user to the existing user, so the identities will be different.

The answer is B. Sync all the Active Directory user accounts to Azure Active Directory (Azure AD) using AAD Connect or importing the users from AD DS.

B is the answer.

<https://learn.microsoft.com/en-us/azure/active-directory/hybrid/how-to-connect-sync-what-is>

The Azure Active Directory Connect synchronization services (Azure AD Connect sync) is a main component of Azure AD Connect. It takes care of all the operations that are related to synchronize identity data between your on-premises environment and Azure AD. Azure AD Connect sync is the successor of DirSync, Azure AD Sync, and Forefront Identity Manager with the Azure Active Directory Connector configured.

upvoted 1 times
- zelck

8 months, 2 weeks ago

Synchronizing all the Active Directory user accounts to Azure Active Directory (Azure AD) can minimize the impact on users after the planned migration as it ensures that all the same user accounts exist in both the on-premises environment and the Azure environment, so users don't have to remember different usernames and passwords. This allows users to continue using the same credentials they've been using before the migration, which reduces friction and support requirements.

upvoted 1 times
- zelck

8 months, 2 weeks ago

<https://learn.microsoft.com/en-us/training/modules/describe-azure-identity-access-security/2-directory-services>
If you had an on-premises environment running Active Directory and a cloud deployment using Azure AD, you would need to maintain two identity sets. However, you can connect Active Directory with Azure AD, enabling a consistent identity experience between cloud and on-premises.

One method of connecting Azure AD with your on-premises AD is using Azure AD Connect. Azure AD Connect synchronizes user identities between on-premises Active Directory and Azure AD. Azure AD Connect synchronizes changes between both identity systems, so you can use features like SSO, multifactor authentication, and self-service password reset under both systems.

  **BShelat** 1 year, 5 months ago
Option B makes sense for the scenario while on premise assets are migrating to Azure. To make life easy during migration you want to sync user credentials on premise to Azure AD. But "after migration" you do not even want to have Azure AD connect exists since you are already done with migration and so option B does NOT make sense for the scenario for the "after migration" environment. MFA would make life easy once on premise assets are migrated to cloud. So I would go with Option A considering the words "After migration". What do you say guys?
upvoted 1 times

  **[Removed]** 2 years ago
Answer B is correct. But you do not sync a password, you sync a hash of a password. That is the password is stored in local Windows AD as a hash, then a salt value is added (a number), and this construct is hashed 1000 times. For a user in practical terms the password is synced, but for us Europeans no local password is stored in Azure AD.

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
You can configure the Azure Active Directory (Azure AD) activity logs to appear in Azure Monitor.	☐	☐
From Azure Monitor, you can monitor resources across multiple Azure subscriptions.	☐	☐
From Azure Monitor, you can create alerts.	☐	☐

Answer Area

Statements	Yes	No
You can configure the Azure Active Directory (Azure AD) activity logs to appear in Azure Monitor.	☒	☐
From Azure Monitor, you can monitor resources across multiple Azure subscriptions.	☒	☐
From Azure Monitor, you can create alerts.	☒	☐

Correct Answer:

Box 1: Yes -

You can send Azure AD activity logs to Azure Monitor logs to enable rich visualizations, monitoring and alerting on the connected data. All data collected by Azure Monitor fits into one of two fundamental types, metrics and logs (including Azure AD activity logs). Activity logs record when resources are created or modified. Metrics tell you how the resource is performing and the resources that it's consuming.

Box 2: Yes -

Azure Monitor can consolidate log entries from multiple Azure resources, subscriptions, and tenants into one location for analysis together.

Box 3: Yes -

You can create alerts in Azure Monitor. Alerts in Azure Monitor proactively notify you of critical conditions and potentially attempt to take corrective action. Alert rules based on metrics provide near real time alerting based on numeric values, while rules based on logs allow for complex logic across data from multiple sources.

<https://learn.microsoft.com/en-us/training/modules/describe-monitoring-tools-azure/4-describe-azure-monitor>

Azure Monitor is a platform for collecting data on your resources, analyzing that data, visualizing the information, and even acting on the results. Azure Monitor can monitor Azure resources, your on-premises resources, and even multi-cloud resources like virtual machines hosted with a different cloud provider.

Azure Monitor Alerts are an automated way to stay informed when Azure Monitor detects a threshold being crossed. You set the alert conditions, the notification actions, and then Azure Monitor Alerts notifies when an alert is triggered. Depending on your configuration, Azure Monitor Alerts can also attempt corrective action.

Question #276

Topic 1

HOTSPOT -

You create a resource group named RG1 in Azure Resource Manager.

You need to prevent the accidental deletion of the resources in RG1.

Which setting should you use? To answer, select the appropriate setting in the answer area.

Hot Area:

Correct Answer:

You can configure a lock on a resource group to prevent the accidental deletion.

As an administrator, you may need to lock a subscription, resource group, or resource to prevent other users in your organization from accidentally deleting or modifying critical resources. You can set the lock level to CanNotDelete or ReadOnly. In the portal, the locks are called Delete and Read-only respectively.

☞ CanNotDelete means authorized users can still read and modify a resource, but they can't delete the resource.

☞ ReadOnly means authorized users can read a resource, but they can't delete or update the resource. Applying this lock is similar to

restricting all authorized users to the permissions granted by the Reader role.

Reference:

<https://docs.microsoft.com/en-us/azure/azure-resource-manager/resource-group-lock-resources>

🗒️ 👤 **Abdelbaki** Highly Voted 🍌 1 year, 7 months ago

Correct

upvoted 8 times

🗒️ 👤 **zellick** Most Recent ⌚ 8 months, 2 weeks ago

"Locks" is the answer.

<https://learn.microsoft.com/en-us/azure/azure-resource-manager/management/lock-resources>

As an administrator, you can lock an Azure subscription, resource group, or resource to protect them from accidental user deletions and modifications. The lock overrides any user permissions.

You can set locks that prevent either deletions or modifications. In the portal, these locks are called Delete and Read-only. In the command line, these locks are called CanNotDelete and ReadOnly.

- CanNotDelete means authorized users can read and modify a resource, but they can't delete it.

upvoted 2 times

🗒️ 👤 **zellick** 8 months, 2 weeks ago

<https://learn.microsoft.com/en-us/training/modules/describe-features-tools-azure-for-governance-compliance/4-describe-purpose-of-resource-locks>

A resource lock prevents resources from being accidentally deleted or changed.

Even with Azure role-based access control (Azure RBAC) policies in place, there's still a risk that people with the right level of access could delete critical cloud resources. Resource locks prevent resources from being deleted or updated, depending on the type of lock. Resource locks can be applied to individual resources, resource groups, or even an entire subscription. Resource locks are inherited, meaning that if you place a resource lock on a resource group, all of the resources within the resource group will also have the resource lock applied.

upvoted 1 times

Question #277

Topic 1

You have a resource group named RG1.

You need to prevent the creation of virtual machines in RG1. The solution must ensure that other objects can be created in RG1.

What should you use?

- A. a lock
- B. an Azure role
- C. a tag
- D. an Azure policy

Correct Answer: D

Azure policies can be used to define requirements for resource properties during deployment and for already existing resources. Azure Policy controls properties such as the types or locations of resources.

Azure Policy is a service in Azure that you use to create, assign, and manage policies. These policies enforce different rules and effects over your resources, so those resources stay compliant with your corporate standards and service level agreements.

In this question, we would create an Azure policy assigned to the resource group that denies the creation of virtual machines in the resource group.

You could place a read-only lock on the resource group. However, that would prevent the creation of any resources in the resource group, not virtual machines only. Therefore, an Azure Policy is a better solution.

8 months, 2 weeks ago

Selected Answer: D

D is the answer.

<https://learn.microsoft.com/en-us/azure/governance/policy/overview#policy-definition>

The journey of creating and implementing a policy in Azure Policy begins with creating a policy definition. Every policy definition has conditions under which it's enforced. And, it has a defined effect that takes place if the conditions are met.

In Azure Policy, we offer several built-in policies that are available by default. For example:
- Not allowed resource types (Deny): Prevents a list of resource types from being deployed.
upvoted 3 times

  **LK009** 10 months ago

We can use a lock or policy if it other statement is not present in question that 'other object can be created'.

Selected Answer: A

A is the answer.

<https://learn.microsoft.com/en-us/azure/active-directory/conditional-access/overview#common-signals>
Common signals that Conditional Access can take in to account when making a policy decision include the following signals:
- Users with devices of specific platforms or marked with a specific state can be used when enforcing Conditional Access policies.
upvoted 1 times

zelck 8 months, 2 weeks ago

A conditional access policy is a feature of Azure Active Directory (Azure AD) that enables you to control access to cloud applications based on a set of conditions. You can use a conditional access policy to restrict access to Azure AD-integrated applications to only those devices that meet certain security requirements, such as having the latest security patches installed.

By implementing a conditional access policy, you can ensure that only users whose devices have the latest security patches can access Azure AD-integrated applications, while blocking access for users with devices that do not meet the security requirements.
upvoted 4 times

zelck 8 months, 2 weeks ago

<https://learn.microsoft.com/en-us/training/modules/describe-azure-identity-access-security/5-conditional-access>
Conditional Access is a tool that Azure Active Directory uses to allow (or deny) access to resources based on identity signals. These signals include who the user is, where the user is, and what device the user is requesting access from.

Conditional Access is useful when you need to:
- Require users to access your application only from managed devices. A managed device is a device that meets your standards for security and compliance.

Question #279

Topic 1

What can Azure Information Protection encrypt?

- A. network traffic
- B. documents and email messages
- C. an Azure Storage account
- D. an Azure SQL database

Correct Answer: B

Azure Information Protection can encrypt documents and emails.

Azure Information Protection is a cloud-based solution that helps an organization to classify and optionally, protect its documents and emails by applying labels.

Labels can be applied automatically by administrators who define rules and conditions, manually by users, or a combination where users are given recommendations.

The protection technology uses Azure Rights Management (often abbreviated to Azure RMS). This technology is integrated with other Microsoft cloud services and applications, such as Office 365 and Azure Active Directory.

This protection technology uses encryption, identity, and authorization policies. Similarly to the labels that are applied, protection that is applied by using Rights Management stays with the documents and emails, independently of the location æ" inside or outside your organization, networks, file servers, and applications.

"Azure AD" is the answer.

<https://learn.microsoft.com/en-us/azure/active-directory/manage-apps/what-is-single-sign-on>

upvoted 1 times

🗨️ **zelck** 8 months, 2 weeks ago

<https://learn.microsoft.com/en-us/training/modules/describe-azure-identity-access-security/3-authentication-methods>

Azure AD provides services such as:

- Single sign-on: Single sign-on (SSO) enables you to remember only one username and one password to access multiple applications. A single identity is tied to a user, which simplifies the security model. As users change roles or leave an organization, access modifications are tied to that identity, which greatly reduces the effort needed to change or disable accounts.

Question #284

Topic 1

HOTSPOT -

To complete the sentence, select the appropriate option in the answer area.

Hot Area:

Answer Area

You have an Azure virtual network named VNET1 in a resource group named RG1.

You assign the Azure Policy definition of Not Allowed Resource Type and specify that virtual networks are not an allowed resource type in RG1. VNET1

- is deleted automatically.
- is moved automatically to another resource group.
- continues to function normally.
- is now a read-only object.

Answer Area

You have an Azure virtual network named VNET1 in a resource group named RG1.

You assign the Azure Policy definition of Not Allowed Resource Type and specify that virtual networks are not an allowed resource type in RG1. VNET1

Correct Answer:

- is deleted automatically.
- is moved automatically to another resource group.
- continues to function normally.
- is now a read-only object.

The VNet will be marked as 'Non-compliant' when the policy is assigned. However, it will not be deleted and will continue to function normally. Azure Policy is a service in Azure that you use to create, assign, and manage policies. These policies enforce different rules and effects over your resources, so those resources stay compliant with your corporate standards and service level agreements.

If there are any existing resources that aren't compliant with a new policy assignment, they appear under Non-compliant resources.

upvoted 1 times

🗨️ 👤 **Vish1000** 1 year, 5 months ago

Correct answer - azure policy does have remediation tasks with some policies but Azure will not remove the resource here. It will just be flagged for non-compliance and as per the shared responsibility model, our account our responsibility.

upvoted 3 times

🗨️ 👤 **Georgess** 1 year, 11 months ago

The following are the times or events that cause a resource to be evaluated:

-A resource is created, updated, or deleted in a scope with a policy assignment.

-A policy or initiative is newly assigned to a scope.

-A policy or initiative already assigned to a scope is updated.

-During the standard compliance evaluation cycle, which occurs once every 24 hours.

(<https://docs.microsoft.com/en-us/azure/governance/policy/overview>)

(Doesn't count too much for this question but is good information)

Isn't this one Read Only Object vs continues to function normally?

upvoted 2 times

🗨️ 👤 **GreenyErin** 2 years, 6 months ago

I've tried to find anything on the subject, but the only thing MS writes is that the resource becomes non-compliant - they don't mention any 'read only' or other changes that can happen to the resource. So I would assume the correct answer should be "function normally", but it's on the base of no other evidence rather than any solid source.

upvoted 11 times

🗨️ 👤 **vajeje** 2 years, 6 months ago

Your answer is correct. The RSG will get the status non-compliant. Unless you specify a remediation in the policy, the current configuration will not get altered.

Answer Area

Statements	Yes	No
You can use Azure Policy to apply tags to resources	☐	☐
You can add multiple tags to the same Azure resource	☐	☐
An Azure resource inherits tags from the resource group to which the resource is deployed	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
You can use Azure Policy to apply tags to resources	☒	☐
You can add multiple tags to the same Azure resource	☒	☐
An Azure resource inherits tags from the resource group to which the resource is deployed	☐	☒

Box 1: Yes -

You use Azure Policy to enforce tagging rules and conventions.

Box 2: Yes -

Each resource or resource group can have a maximum of 50 tags.

Box 3: No -

Tags applied to the resource group or subscription aren't inherited by the resources.

Reference:

<https://docs.microsoft.com/en-us/azure/azure-resource-manager/management/tag-policies> <https://docs.microsoft.com/en-us/azure/governance/policy/tutorials/govern-tags> <https://docs.microsoft.com/en-us/azure/azure-resource-manager/management/tag-resources>

  **sephir**  1 year, 7 months ago

It's correct: Q1 YES

"Instead of manually applying tags or searching for resources that aren't compliant, you create a policy that automatically applies the needed tags during deployment."

<https://docs.microsoft.com/en-us/azure/azure-resource-manager/management/tag-policies#:~:text=Instead%20of%20manually%20applying%20tags%20or%20searching%20for%20resources%20that%20aren%27t%20compliant%2C%20you%20create%20a%20policy%20that%20automatically%20applies%20the%20needed%20tags%20during%20deployment.>

upvoted 8 times

  **mafermv**  1 year, 7 months ago

Q1: YES.

You use Azure Policy to enforce tagging rules and conventions. By creating a policy, you avoid the scenario of resources being deployed to your subscription that don't have the expected tags for your organization. Instead of manually applying tags or searching for resources that aren't compliant, you create a policy that automatically applies the needed tags during deployment. Tags can also now be applied to existing resources

with the new Modify effect and a remediation task. The following section shows example policy definitions for tags.

Question #287

Topic 1

DRAG DROP -

Match the resources to the appropriate descriptions.

To answer, drag the appropriate resource from the column on the left to its description on the right. Each resource may be used once, more than once, or not at all.

NOTE: Each correct match is worth one point.

Select and Place:

Resources

- Data Protection Addendum
- Microsoft Privacy Statement
- Online Services Terms

Answer Area

- Resource

Describes which personal data is collected, how the data is used, and what the data is used for.
- Resource

A legal agreement that details the obligations between Microsoft and a customer regarding the processing and security of customer data and personal data.
- Resource

Defines the data processing and security terms for online services, including the disclosure of processed data and the transfer, retention, and deletion of data.

Correct Answer:

Resources

Data Protection Addendum

Microsoft Privacy Statement

Online Services Terms

Answer Area

Microsoft Privacy Statement

Describes which personal data is collected, how the data is used, and what the data is used for.

Data Protection Addendum

A legal agreement that details the obligations between Microsoft and a customer regarding the processing and security of customer data and personal data.

Online Services Terms

Defines the data processing and security terms for online services, including the disclosure of processed data and the transfer, retention, and deletion of data.

Reference:

mafermv

Highly Voted

1 year, 7 months ago

The answer must be:

1. Microsoft Privacy Statement

2. Online Services Terms: The Online Services Terms (OST) is a legal agreement between Microsoft and the customer. The OST details the obligations by both parties with respect to the processing and security of customer data and personal data. The OST applies specifically to Microsoft's online services that you license through a subscription, including Azure, Dynamics 365, Office 365, and Bing Maps.

3. Data Protection Addendum: The Data Protection Addendum (DPA) further defines the data processing and security terms for online services. These terms include, Disclosure of processed data, Data transfer, retention, and deletion, etc..

<https://docs.microsoft.com/en-gb/learn/modules/examine-privacy-compliance-data-protection-standards/3-access-microsoft-privacy-statement>

 Cloud_Ryder 7 months, 3 weeks ago

What is Microsoft Azure operated by 21Vianet?

Microsoft Azure operated by 21Vianet (Azure China) is a physically separated instance of cloud services located in China. It's independently operated and transacted by Shanghai Blue Cloud Technology Co., Ltd. ("21Vianet"), a wholly owned subsidiary of Beijing 21Vianet Broadband Data Center Co., Ltd..

upvoted 1 times

 NosFerazi 8 months ago

Microsoft Azure services operated by 21Vianet are a standalone instance, separating from Azure Global services. Therefore, the service availability is not identical to global Azure, however, this does not change the quality of available services.

upvoted 1 times

 azirila 8 months ago

i think answer is right, read this especially last allien so has same parity with azure And separate instance of azure GLOBAL
In accordance with Chinese regulatory requirements, Azure regions operated by 21Vianet in China are physically separated instances from Microsoft's global cloud but are built on the same cloud technical base as its global peers

upvoted 1 times

 kazan 8 months, 1 week ago

Microsoft Azure operated by 21Vianet (Azure China) is a physically separated instance of cloud services located in China. MS gave in to the commies.

 zelck 8 months, 2 weeks ago

"distinct separate instance of Microsoft Azure" is the answer.

<https://learn.microsoft.com/en-us/azure/china/overview-operations>

Microsoft Azure operated by 21Vianet (Azure China) is a physically separated instance of cloud services located in China. It's independently operated and transacted by Shanghai Blue Cloud Technology Co., Ltd. ("21Vianet"), a wholly owned subsidiary of Beijing 21Vianet Broadband Data Center Co., Ltd..

Azure China has a feature parity gap, but the gap is narrowing.

upvoted 4 times

 Pinha 8 months, 2 weeks ago

Answer is D

"Feature parity" means "same feature".

Azure China is a version of Microsoft Azure that is operated by 21Vianet, a Chinese internet service provider. It is separate from the global version of Azure and is subject to Chinese laws and regulations. While Azure China and Azure global share many common features, there are some differences in the services and features that are offered.

For example, Azure China offers a subset of the services that are available in Azure global. Some services that are available in Azure global may not be available in Azure China, or may have different capabilities or limitations. In addition, Azure China may have different pricing, billing, and support options compared to Azure global.

Question #291

Topic 1

HOTSPOT -

Select the answer that correctly completes the sentence.

Hot Area:

Answer Area

You can review audit reports and compliance-related information for Azure services from

-
- Microsoft Defender for Cloud.
- the Microsoft Defender for Identity admin center.
- the Microsoft 365 Compliance center.
- the Microsoft Service Trust Portal.

Correct Answer:

Answer Area

You can review audit reports and compliance-related information for Azure services from

-
- Microsoft Defender for Cloud.
- the Microsoft Defender for Identity admin center.
- the Microsoft 365 Compliance center.
- the Microsoft Service Trust Portal.

Microsoft Service Trust Portal.

The Microsoft Service Trust Portal provides a variety of content, tools, and other resources about Microsoft security, privacy, and compliance practices.

Trust Documents -

Provides a wealth of security implementation and design information with the goal of making it easier for you to meet regulatory compliance objectives by understanding how Microsoft Cloud services keep your data secure. To review content, select one of the following options on the Trust Documents pull-down menu.

- * Audit Reports: A list of independent audit and assessment reports on Microsoft's Cloud services is displayed. These reports provide information about Microsoft Cloud services compliance with data protection standards and regulatory requirements.
- * Data Protection: Contains a wealth of resources such as audited controls, white papers, FAQs, penetration tests, risk assessment tools, and compliance guides.
- * Azure Security and Compliance Blueprints: Resources that help you build secure and compliant cloud-based applications. This area contains blueprint-guidance for government, finance, healthcare, and retail verticals.

Incorrect:

Not: Microsoft Defender for Cloud.

Defender for Cloud is a tool for security posture management and threat protection. It strengthens the security posture of your cloud resources, and with its integrated Microsoft Defender plans, Defender for Cloud protects workloads running in Azure, hybrid, and other cloud platforms. Defender for Cloud provides the tools needed to harden your resources, track your security posture, protect against cyber attacks, and streamline security management.

Not: the Microsoft 365 Compliance center

The Security & Compliance Center lets you grant permissions to people who perform compliance tasks like device management, data loss prevention, eDiscovery, retention, and so on. These people can perform only the tasks that you explicitly grant them access to.

Question #293

Topic 1

Your company has an Azure subscription that contains resources in several regions.

You need to create the Azure resource that must be used to meet the policy requirement.

What should you create?

- A. a read-only lock
- B. an Azure policy
- C. a management group
- D. a reservation

Correct Answer: B

Azure policies can be used to define requirements for resource properties during deployment and for already existing resources. Azure Policy controls properties such as the types or locations of resources.

Azure Policy is a service in Azure that you use to create, assign, and manage policies. These policies enforce different rules and effects over your resources, so those resources stay compliant with your corporate standards and service level agreements. Azure Policy meets this need by evaluating your resources for non- compliance with assigned policies. All data stored by Azure Policy is encrypted at rest.

Azure Policy offers several built-in policies that are available by default. In this question, we would use the 'Allowed Locations' policy to define the locations where resources can be deployed.

Reference:

<https://docs.microsoft.com/en-us/azure/governance/policy/overview>

Correct answer

upvoted 5 times
- zelck

Most Recent

8 months, 2 weeks ago

Selected Answer: B

B is the answer.

<https://learn.microsoft.com/en-us/azure/governance/policy/overview>

Azure Policy helps to enforce organizational standards and to assess compliance at-scale. Through its compliance dashboard, it provides an aggregated view to evaluate the overall state of the environment, with the ability to drill down to the per-resource, per-policy granularity. It also helps to bring your resources to compliance through bulk remediation for existing resources and automatic remediation for new resources.

upvoted 2 times
- zelck

8 months, 2 weeks ago

An Azure policy is a feature in Azure that allows you to define rules for your Azure resources. These rules can be used to ensure that your resources meet specific requirements, such as compliance standards or company policies. For example, you can create a policy that requires all virtual machines to be in a certain region, or that all storage accounts must use a specific redundancy level. You can assign policies at the subscription, resource group, or resource level.

Once you have created and assigned a policy, Azure evaluates the policy on a regular basis and reports on any resources that do not comply with the policy.

upvoted 1 times
- zelck

8 months, 2 weeks ago

<https://learn.microsoft.com/en-us/training/modules/describe-features-tools-azure-for-governance-compliance/3-describe-purpose-of-azure-policy>

Azure Policy is a service in Azure that enables you to create, assign, and manage policies that control or audit your resources. These policies enforce different rules across your resource configurations so that those configurations stay compliant with corporate standards.

Question #294

Topic 1

This question requires that you evaluate the underlined text to determine if it is correct.

From Azure Cloud Shell, you can track your company's regulatory standards and regulations, such as ISO 27001.

Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed.` If the statement is incorrect, select the answer choice that makes the statement correct.

- A. No change is needed.
- B. the Microsoft Cloud Partner Portal
- C. Compliance Manager
- D. the Trust Center

Correct Answer: C

Microsoft Compliance Manager (Preview) is a free workflow-based risk assessment tool that lets you track, assign, and verify regulatory compliance activities related to Microsoft cloud services. Azure Cloud Shell, on the other hand, is an interactive, authenticated, browser-accessible shell for managing Azure resources.

Azure AD does NOT support group policies
Answer = NYN
upvoted 5 times

  **some_specialist** 1 year, 12 months ago

Azure ADDS is absolutely not a feature of Azure AD. Azure ADDS has to be added to an Azure Subscription, configured to use it's own Virtual Network, and also access via RSAT snap-ins. Azure ADDS supports secure LDAP, as well as GPOs. Try configuring GPOs from the AzureAD portal, or I can save you the time and tell you that you cant.

Yes
Yes
Azure Active Directory (Azure AD) does not support the creation of Group Policies in the same way that on-premises Active Directory (AD) does. Group Policies, as they are traditionally understood, are used to manage and enforce settings on Windows-based devices within an on-premises AD environment.
upvoted 1 times

  **speedyweedy** 4 months, 3 weeks ago
Correct answer is NYY

Azure AD does not support GPs in a similar way as windows active directory, you need Azure AD DS which is a separate service from Azure AD, and requires additional configuration and setup. Also, AAD DS is not included with every Azure subscription, so you'll need to check if it's available in your subscription before you can use it.

To join an Android device to Azure AD using Microsoft Intune or Azure AD Device Management, you must first set up a device enrollment profile and configure the necessary settings to enable Azure AD Join. Once the device is enrolled and joined to Azure AD, you can manage the device and apply policies and configurations to ensure secure access to your organization's resources.

YYN is the answer.

<https://learn.microsoft.com/en-us/training/modules/describe-azure-identity-access-security/2-directory-services>
Azure Active Directory Domain Services (Azure AD DS) is a service that provides managed domain services such as domain join, group policy, lightweight directory access protocol (LDAP), and Kerberos/NTLM authentication. Just like Azure AD lets you use directory services without having to maintain the infrastructure supporting it, with Azure AD DS, you get the benefit of domain services without the need to deploy, manage, and patch domain controllers (DCs) in the cloud.

Question #297

Topic 1

HOTSPOT -

To complete the sentence, select the appropriate option in the answer area.

Hot Area:

Answer Area

is the process of verifying a user's credentials.

Authorization
Authentication
Federation
Ticketing

Correct Answer:

Answer Area

is the process of verifying a user's credentials.

Authorization
Authentication
Federation
Ticketing

Authentication, not authorization is the process of verifying a user's credentials.

The difference between authentication and authorization is:

- ⇒ Authentication is proving your identity, proving that you are who you say you are. The most common example of this is logging in to a system by providing credentials such as a username and password.
- ⇒ Authorization is what you're allowed to do once you've been authenticated. For example, what resources you're allowed to access and what you can do with those resources.

- nickosems

"collect of policy definitions" is the answer.

<https://learn.microsoft.com/en-us/azure/governance/policy/overview#initiative-definition>

An initiative definition is a collection of policy definitions that are tailored toward achieving a singular overarching goal. Initiative definitions simplify managing and assigning policy definitions. They simplify by grouping a set of policies as one single item. For example, you could create an initiative titled Enable Monitoring in Microsoft Defender for Cloud, with a goal to monitor all the available security recommendations in your Microsoft Defender for Cloud instance.

Indeed its Management Group

upvoted 3 times
- onincasimiro

Highly Voted

2 years, 3 months ago

C is correct.

<https://docs.microsoft.com/en-us/azure/governance/management-groups/overview>

"If your organization has many subscriptions, you may need a way to efficiently manage access, policies, and compliance for those subscriptions. Azure management groups provide a level of scope above subscriptions. You organize subscriptions into containers called "management groups" and apply your governance conditions to the management groups. All subscriptions within a management group automatically inherit the conditions applied to the management group. Management groups give you enterprise-grade management at a large scale no matter what type of subscriptions you might have.....

For example, you can apply POLICIES to a management group that limits the regions available for virtual machine (VM) creation. This policy would be applied to all management groups, subscriptions, and RESOURES under that management group by only allowing VMs to be created in that region."

Question is about "manage the COMPLIANCE of Azure RESOURCES", so Azure Policy is correct.
upvoted 25 times
- CertKid

2 years ago

I think onin is right. You apply policies to the management groups which would apply to all the subs, resources, etc.

upvoted 3 times

  **VIP_G** 1 year, 5 months ago

I think it is Management Groups because as per the question it is just asking what provides the ability to manage the compliance of Azure resources across multiple subscriptions. The subscriptions have not been grouped into management groups. You would need to do that first in order to be able to then apply the policy.

upvoted 3 times

  **Nguyen25183** Most Recent 3 months, 1 week ago

let see Microsoft employee answer:
<https://learn.microsoft.com/en-us/answers/questions/720850/azure-policy-and-management>
The answer is: Management groups.

upvoted 2 times

  **Sa_Msa** 5 months, 3 weeks ago

The key term in this context is “Azure Resources.” Management groups can be used to manage access, policies, and compliance for subscriptions at the subscription level. However, Azure Policy can be applied at the resource level, subscription level, and management group level. Therefore, since the question pertains to Azure resources specifically, Azure Policy would be the most appropriate choice.

upvoted 2 times

  **Rohit2023** 6 months, 3 weeks ago

Management Groups is the answer.

Management groups
Management groups can provide organizations with the ability to manage the compliance of Azure resources across multiple subscriptions. This sentence “Across multiple subscriptions” made me go with Management groups.

Repeat #410

You can use Azure Blueprints to grant permissions to a resource.	☐	☐

Answer Area

Statements	Yes	No
You can add an Azure Resource Manager template to an Azure blueprint.	☒	☐
You can assign an Azure blueprint to a resource group.	☐	☒
You can use Azure Blueprints to grant permissions to a resource.	☒	☐

Correct Answer:

Reference:

<https://docs.microsoft.com/en-us/azure/governance/blueprints/overview>

 **FabiZamora93** Highly Voted 2 years, 5 months ago

Based on <https://docs.microsoft.com/en-us/azure/governance/blueprints/overview>

Y: Each blueprint can consist of zero or more ARM template artifacts. This support means that previous efforts to develop and maintain a library of ARM templates are reusable in Azure Blueprints.

N:Create a new resource group for use by other artifacts WITHIN the blueprint. When creating a blueprint definition, you'll define where the blueprint is saved. Blueprints can be saved to a management group or subscription that you have Contributor access to. If the location is a management group, the blueprint is available to assign to any child subscription of that management group. Each Published Version of a blueprint can be assigned (with a max name length of 90 characters) to an existing management group or subscription.

Y:The blueprint definition permissions must be granted or inherited on the management group or subscription scope where it is saved --> Meaning this would grant permissions to the resources
upvoted 78 times

 **Lakoth** Highly Voted 2 years, 6 months ago

The answer is correct: "Each Published Version of a blueprint can be assigned (with a max name length of 90 characters) to an existing management group or subscription"

source: <https://docs.microsoft.com/en-us/azure/governance/blueprints/overview#blueprint-assignment>

-> B=NO (cannot be assigned to a resource group)

-> C=YES (can be assigned to a management group or subscription, which would grant permissions to the resources)

Provided answer is correct
Source : <https://learn.microsoft.com/en-us/azure/governance/blueprints/overview>

- 1 : Blueprints are a declarative way to orchestrate the deployment of various resource templates and other artifacts such as: Azure Resource Manager templates (ARM templates)
- 2 Resource group can be a a part of Azure Blueprint deployment but itself can be part of MANAGEMENT GROUP
- 3 Yes, you can grant permission to resources

Soo the answer is Y/N/Y
upvoted 2 times

  **speedyweedy** 4 months, 3 weeks ago
answer is YYY

In Azure, you can assign an Azure blueprint to a resource group. When you assign a blueprint to a resource group, the blueprint's policy definitions and assigned resources are deployed to that resource group.

Before you can assign a blueprint to a resource group, you must first create the blueprint and publish it. You can create a blueprint using the Azure Portal, Azure PowerShell, or Azure CLI. Once the blueprint is created, you can assign it to a resource group using the Azure Portal, Azure PowerShell, or Azure CLI.

When you assign a blueprint to a resource group, the blueprint's artifacts are deployed to the resource group. The artifacts can include policy definitions, resource groups, resource providers, role assignments, and more. The blueprint ensures that the deployed resources are in compliance with your organization's standards and requirements.

Answer Area

Statements	Yes	No
An Azure resource can have multiple Delete locks.	☒	☐
An Azure resource inherits locks from its resource group.	☒	☐
If an Azure resource has a Read-only lock, you can add a Delete lock to the resource.	☒	☐

References:

<https://docs.microsoft.com/en-us/azure/azure-resource-manager/management/lock-resources>

-   **SimonR2** Highly Voted 2 years, 5 months ago

A - Can you have multiple delete locks on a resource? YES
Confirmed, with screenshots in the below article.

- <https://stackoverflow.com/questions/65408486/why-azure-provides-multiple-delete-locks-on-a-virtual-machine>

B - Are locks inherited from a resource group? YES
When you apply a lock at a parent scope, all resources within that scope inherit the same lock. Even resources you add later inherit the lock from the parent. The most restrictive lock in the inheritance takes precedence.
If you want to create a lock at a parent level, select the parent. The currently selected resource inherits the lock from the parent. For example, you could lock the resource group to apply a lock to all its resources.

- <https://docs.microsoft.com/en-us/azure/azure-resource-manager/management/lock-resources#:~:text=In%20the%20Settings%20blade%20for,the%20lock%20from%20the%20parent>

C - If you have a read only lock, can you add a delete lock? YES
Confirmed as possible by vasonic in a previous comment in lab.
upvoted 68 times
-   **vasonic** Highly Voted 2 years, 7 months ago

The answer in box 3 is yes, I have student subscription for Azure and I just tried adding a read-only lock and then adding a delete lock. It was successful. So BOX 3 -> YES

what is the answer?

upvoted 1 times
- AzureCloud07** 9 months, 3 weeks ago

Resource Lock - Prevent accidental deletion/modification of resources:
Applicable at multiple levels: subscription, resource group, or resource
^Azure Resource inherits locks from its resource group and subscriptions
Two options: CanNotDelete and ReadOnly
Locked resource should be unlocked before it can be changed (even by owners)
Two Options:
ReadOnlyLock : Authorized users can read BUT they can't delete or update the resource
CannotDelete : Authorized users can read and modify BUT they can't delete the resource
Example : If a Resource Group has a Delete Lock, then administrator can first remove DELETE lock before she can delete the resources
You can have multiple locks at different levels

Question #304

Topic 1

Your company plans to migrate all on-premises data to Azure.
You need to identify whether Azure complies with the company's regional requirements.
What should you use?

- A. the Knowledge Center
- B. Azure Marketplace
- C. the MyApps portal
- D. the Trust Center

Correct Answer: D

Azure has more than 90 compliance certifications, including over 50 specific to global regions and countries, such as the US, the European Union, Germany, Japan, the United Kingdom, India and China.

You can view a list of compliance certifications in the Trust Center to determine whether Azure meets your regional requirements.

The Trust Center is a website that provides information about the security, privacy, and compliance of Azure services. It includes information about compliance certifications, standards, and regulations that Azure meets or that customers can use to assess Azure's compliance with their own requirements. It will give you the overview of what certifications Azure has achieved and the compliance standards it meets. This can help you determine if Azure meets the company's regional requirements.

Question #305

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
Authorization to access Azure resources can be provided only to Azure Active Directory (Azure AD) users.	☐	☐
Identities stored in Azure Active Directory (Azure AD), third-party cloud services, and on-premises Active Directory can be used to access Azure resources.	☐	☐
Azure has built-in authentication and authorization services that provide secure access to Azure resources.	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
Authorization to access Azure resources can be provided only to Azure Active Directory (Azure AD) users.	☐	☒
Identities stored in Azure Active Directory (Azure AD), third-party cloud services, and on-premises Active Directory can be used to access Azure resources.	☒	☐
Azure has built-in authentication and authorization services that provide secure access to Azure resources.	☒	☐

Box 1: No -

Authorization to access Azure resources can be provided by other identity providers by using federation. A commonly used example of this is to federate your on- premises Active Directory environment with Azure AD and use this federation for authentication and authorization.

Box 2: Yes -

As described above, third-party cloud services and on-premises Active Directory can be used to access Azure resources. This is known as 'federation'.

Federation is a collection of domains that have established trust. The level of trust may vary, but typically includes authentication and almost always includes authorization. A typical federation might include a number of organizations that have established trust for shared access to a set of resources.

Box 3: Yes -

Azure Active Directory (Azure AD) is a centralized identity provider in the cloud. This is the primary built-in authentication and authorization service to provide secure access to Azure resources.

References:

<https://docs.microsoft.com/en-us/azure/active-directory/hybrid/whatis-fed> <https://docs.microsoft.com/en-us/azure/active-directory/develop/authentication-scenarios>

second question is yes : <https://docs.microsoft.com/en-us/azure/active-directory/external-identities/compare-with-b2c>

upvoted 1 times

  **starseed** 2 years, 3 months ago

Azure Active Directory (Azure AD) is a centralized identity provider in the cloud. Delegating authentication and authorization to it enables scenarios such as:

Conditional Access policies that require a user to be in a specific location.

The use of multi-factor authentication, which is sometimes called two-factor authentication or 2FA.

Enabling a user to sign in once and then be automatically signed in to all of the web apps that share the same centralized directory. This capability is called single sign-on (SSO).

3rd box - yes

<https://docs.microsoft.com/en-us/azure/active-directory/develop/authentication-vs-authorization>

3 yes (can use "conditional access)

upvoted 1 times

HOTSPOT -

To complete the sentence, select the appropriate option in the answer area.

Hot Area:

Answer Area

If a resource group named RG1 has a delete lock,

only a member of the global administrators group

the delete lock must be removed before an administrator

an Azure policy must be modified before an administrator

an Azure tag must be added before an administrator

can delete RG1.

Answer Area

If a resource group named RG1 has a delete lock,

only a member of the global administrators group

the delete lock must be removed before an administrator

an Azure policy must be modified before an administrator

an Azure tag must be added before an administrator

can delete RG1.

Correct Answer:

You can configure a lock on a resource group to prevent the accidental deletion of the resource group. The lock applies to everyone, including global administrators. If you want to delete the resource group, the lock must be removed first.

As an administrator, you may need to lock a subscription, resource group, or resource to prevent other users in your organization from accidentally deleting or modifying critical resources. You can set the lock level to CanNotDelete or ReadOnly. In the portal, the locks are called Delete and Read-only respectively.

⇒ CanNotDelete means authorized users can still read and modify a resource, but they can't delete the resource.

ReadOnly means authorized users can read a resource, but they can't delete or update the resource. Applying this lock is similar to restricting all authorized

- users to the permissions granted by the Reader role.

Question #308

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
Single sign-on (SSO) requires that all users sign in by using the Microsoft Authenticator app.	☐	☐
Authentication is the process of establishing which level of access an authenticated user or service has.	☐	☐
Conditional Access uses signals collected from a user during the sign-in process to decide whether to allow or deny access requests.	☐	☐

Correct Answer:**Answer Area**

Statements	Yes	No
Single sign-on (SSO) requires that all users sign in by using the Microsoft Authenticator app.	☐	☒
Authentication is the process of establishing which level of access an authenticated user or service has.	☐	☒
Conditional Access uses signals collected from a user during the sign-in process to decide whether to allow or deny access requests.	☒	☐

Single sign-on is an authentication method that allows users to sign in using one set of credentials to login across applications. Single sign-on makes it easier to manage passwords and increases security capabilities.

Authorization is the process of establishing what level of access a legitimate user or service should have.

During sign-in, Conditional Access collects signals from the user, makes decisions based on those signals, and then enforces that decision by allowing or denying the access request or challenging for a multifactor authentication response.

Question #309

Topic 1

What is guaranteed in an Azure Service Level Agreement (SLA) for virtual machines?

- A. uptime
- B. feature availability
- C. bandwidth
- D. performance

Correct Answer: A

The SLA for virtual machines guarantees 'uptime'. The amount of uptime guaranteed depends on factors such as whether the VMs are in an availability set or availability zone if there is more than one VM, the distribution of the VMs if there is more than one or the disk type if it is a single VM.

The SLA for Virtual Machines states:

☞ For all Virtual Machines that have two or more instances deployed across two or more Availability Zones in the same Azure region, we guarantee you will have Virtual Machine Connectivity to at least one instance at least 99.99% of the time.

☞ For all Virtual Machines that have two or more instances deployed in the same Availability Set or in the same Dedicated Host Group, we guarantee you will have Virtual Machine Connectivity to at least one instance at least 99.95% of the time.

☞ For any Single Instance Virtual Machine using Premium SSD or Ultra Disk for all Operating System Disks and Data Disks, we guarantee you will have Virtual Machine Connectivity of at least 99.9%.

upvoted 2 times
- zelck

8 months, 2 weeks ago

An Azure Service Level Agreement (SLA) is a commitment by Microsoft to provide a certain level of service availability for a specific Azure service. The SLA for virtual machines guarantees a certain level of uptime for the virtual machine instance. Specifically, it guarantees at least 99.95% availability per month for virtual machines running on a single instance, and 99.99% availability per month for virtual machines running on two or more instances.

Question #310

Topic 1

HOTSPOT -

To complete the sentence, select the appropriate option in the answer area.

Hot Area:

Answer Area

An Azure service is available to all Azure customers when it is in

▼

public preview
private preview
development
an Enterprise Agreement (EA) subscription

Answer Area

Correct Answer:

An Azure service is available to all Azure customers when it is in

▼

public preview
private preview
development
an Enterprise Agreement (EA) subscription

Public Preview means that the service is in public beta and can be tried out by anyone with an Azure subscription. Services in public preview are often offered at a discount price.

Public previews are excluded from SLAs and in some cases, no support is offered.

Incorrect Answers:

Services in private preview are available only to selected people who has signed up to the private preview program.

-
- ☞ Services in development are not available to the public.
- ☞ Services provided under an Enterprise Agreement (EA) subscription are available only to the subscription owner.

Reference:

<https://www.neowin.net/news/several-more-azure-services-now-available-in-private-public-preview/>

- zelck

8 months, 2 weeks ago

"public review" is the answer.

<https://azure.microsoft.com/en-us/support/legal/preview-supplemental-terms>
Public preview – During this phase we allow any customer with the proper Azure AD license to evaluate the new feature. Microsoft Customer Support Services will supply support services during this phase, but normal service level agreements do not apply. For new features exposed in the Azure AD Portal, customer can expect to see information banners in the user interface that draw attention to the new experience available during the preview. By clicking on the information banner customers then opt-in to the preview experience.

Question #311

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

Your company plans to purchase an Azure subscription.

The company's support policy states that the Azure environment must provide an option to access support engineers by phone or email.

You need to recommend which support plan meets the support policy requirement.

Solution: Recommend a Basic support plan.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: B

The Basic support plan does not have any technical support for engineers.

Access to Support Engineers via email or phone is available in the following support plans: Premier, Professional Direct and standard.

Question #314

Topic 1

Your company plans to request an architectural review of an Azure environment from Microsoft.

The company currently has a Basic support plan.

You need to recommend a new support plan for the company. The solution must minimize costs.

Which support plan should you recommend?

- A. Premier
- B. Developer
- C. Professional Direct
- D. Standard

Correct Answer: A

The Premier support plan provides customer specific architectural support such as design reviews, performance tuning, configuration and implementation assistance delivered by Microsoft Azure technical specialists.

Reference:
<https://azure.microsoft.com/en-gb/support/plans/>

Community vote distribution

C (49%)

B (40%)

6%

-   **RTT1976**

Highly Voted 

 3 years, 10 months ago

Only with Premier it's possible to "request an architectural review of an Azure environment from Microsoft." and this is what's being asked.

<https://azure.microsoft.com/en-us/support/plans/>

Premier support plan --> Architecture Support
"Customer specific architectural support such as design reviews, performance tuning, configuration and implementation assistance delivered by Microsoft Azure technical specialists."

Professional Direct support plan it's not enough since it only provides "Architectural guidance based on best practice delivered by ProDirect Delivery Manager"

Developer and Standard are not valid options.

upvoted 54 times
-   **Stevo_WPB1** 3 years, 4 months ago

Premier is not included on that page anymore and professional direct is the top tier. has the premier plan now obsolete?

upvoted 21 times

  **NetoMX** 3 years, 6 months ago

Thank you and agree with that, the tricky stuff it's "architectural review"
upvoted 6 times

  **sbettani** Highly Voted 3 years, 9 months ago

Yes premiere is the most expensive but:
Basic has no architecture support
Developer has only general guidance
Standard has only general guidance
Professional has Architectural guidance based on best practice delivered by ProDirect Delivery Manager

only premiere has architectural support such as design reviews
upvoted 30 times

  **exam_tomorrow_123** 3 years, 3 months ago

Dev & standard do have guidance
upvoted 2 times

  **Gbase** 2 years, 1 month ago

can you point me to the Microsoft or Azure page where it specifically states that premiere has architectural support such as design reviews ?
upvoted 1 times

  **Vitos25** Most Recent 3 weeks, 1 day ago

The premier option I think should be removed or the question should be modified.
This is the main reason why:
If you are NOT working with a Microsoft Gold Partner, your Azure Subscription includes the BASIC Support Plan. You have the possibility to upgrade your support plan to the "Developer" (\$29/month), the "Standard" (\$100/month) or the "Premier" (\$1000/month) support plan at an additional monthly cost
Therefore, according to the same question, the correct answer should be Developer "B"
upvoted 2 times

  **ukguy** 2 months, 3 weeks ago

C is right answer
[https://azure.mihhttps://www.examtopics.com/exams/microsoft/az-900/view/16/#crosoft.com/en-us/support/plans/](https://azure.microsoft.com/en-us/support/plans/)

  **Saxman** 4 months, 1 week ago

Premier doesn't even exist! Check again <https://azure.microsoft.com/en-us/support/plans/>. 2 of the plans offer general architecural support with professional direct providing specific guidance.
upvoted 2 times

  **Marc** 4 months, 2 weeks ago

Chagpt
I'm sorry, but there is no Premier support plan listed on the Azure Support Plans Comparison page 1. There are four support plans listed: Basic, Developer, Standard, and Professional Direct 1. To request an architectural review of an Azure environment from Microsoft and minimize costs, you should recommend the Professional Direct support plan. This plan provides architecture support with guidance from a pool of ProDirect delivery managers 1.

So the correct answer is C. Professional Direct.
upvoted 1 times

  **Marc** 4 months, 2 weeks ago

D (ChatGPT)
Based on the information you provided, I would recommend the Standard support plan for your company. This plan provides support for production workload environments and has an initial response time between one hour and one business day based on case severity 1. It costs \$100 per month 1.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
Most Azure services are introduced in private preview before being introduced in public preview, and then in general availability.	☐	☐
Azure services in public preview can be managed only by using the Azure CLI.	☐	☐
The cost of an Azure service in private preview decreases when the service becomes generally available.	☐	☐

Answer Area

Correct Answer:	Statements	Yes	No
	Most Azure services are introduced in private preview before being introduced in public preview, and then in general availability.	☒	☐
	Azure services in public preview can be managed only by using the Azure CLI.	☐	☒
	The cost of an Azure service in private preview decreases when the service becomes generally available.	☐	☒

Box 1: Yes -
Most services go to private preview then public preview before being released to general availability.
The private preview is only available to certain Azure customers for evaluation purposes. The public preview is available to all Azure customers.

Box 2: No -
Azure services in public preview can be managed using the regular management tools: Azure Portal, Azure CLI and PowerShell.

Box 3: No -
Services in private or public preview are usually offered at reduced costs. However, the costs increase, not decrease when the services are released to general availability.

Question #316

Topic 1

What is required to use Azure Cost Management?

- A. a Dev/Test subscription
- B. Software Assurance
- C. an Enterprise Agreement (EA)
- D. a pay-as-you-go subscription

Correct Answer: C

Azure customers with an Azure Enterprise Agreement (EA), Microsoft Customer Agreement (MCA), or Microsoft Partner Agreement (MPA) can use Azure Cost Management.

Cost management is the process of effectively planning and controlling costs involved in your business. Cost management tasks are normally performed by finance, management, and app teams. Azure Cost Management + Billing helps organizations plan with cost in mind. It also helps to analyze costs effectively and take action to optimize cloud spending.

Is this question right? I believe just need a subscription and not an Enterprise Agreement.
upvoted 64 times
-   **Rayman33** 1 year, 9 months ago

Agreed

Do I need to enable Azure Cost Management and Billing?
No, Azure Cost Management is on by default for Microsoft Enterprise Agreement and Pay-As-You-Go customers.
upvoted 7 times
-   **Sisb** 1 year, 8 months ago

Answer should be D , right?
upvoted 6 times
-   **zimzimzimme** 3 months, 2 weeks ago

It's definitely D. I use Azure for my own personal website with a pay-as-you-go subscription and I just signed into the portal and I clearly see the 'Cost Management + Billing | Cost Management' service.
upvoted 1 times
-   **lachrofe** Highly Voted 3 years, 12 months ago

"Cost Management includes all usage and purchases, including reservations and third-party offerings for Enterprise Agreement (EA) accounts. *****Microsoft Customer Agreement (MCA) accounts and individual subscriptions with pay-as-you-go rates only include usage from Azure and Marketplace services. Support and other costs are not included.***** Costs are estimated until an invoice is generated and do not factor in credits." <https://docs.microsoft.com/en-gb/azure/cost-management/understand-cost-mgt-data>
upvoted 40 times
-   **patje** 2 years, 2 months ago

So answer D, because pay-as-you-go is mentioned as a supported category, right ?
upvoted 4 times
-   **Shami1810** 2 years, 1 month ago

Cost Management includes all usage and purchases, including reservations and third-party offerings for Enterprise Agreement (EA) accounts. Microsoft Customer Agreement accounts and individual subscriptions with pay-as-you-go rates only include usage from Azure and Marketplace services. Support and other costs aren't included. Costs are estimated until an invoice is generated and don't factor in credits.

If you have a new subscription, you can't immediately use Cost Management features. It might take up to 48 hours before you can use all Cost Management features.
It's D,please refer this

Selected Answer: C

Answer is C
Azure portal supports the following type of billing accounts:
Microsoft Online Services Program
Enterprise Agreement
Microsoft Customer Agreement
Microsoft Partner Agreement

https://learn.microsoft.com/en-gb/azure/cost-management-billing/manage/view-all-accounts

upvoted 1 times
- azirila

8 months, 1 week ago

For users with Azure Enterprise Agreements, users' level of access to Cost Management data is determined by a combination of permissions granted in the Azure portal and Enterprise portal (EA). For users with other types of Azure accounts, you can more easily define the user's level of access to Cost Management data by using Azure role-based access control (Azure RBAC). This article explains how to assign access to Cost Management data. After the combination of permissions is assigned, the users can view data in Cost Management based on their scope of access and the scope they select in the Azure portal.

D looks good

upvoted 1 times

  **paritosh_patel** 11 months, 2 weeks ago

Selected Answer: C

as per below link, apart from Enterprise Agreement, pay-as-you-go subscription should also be the answer...

<https://learn.microsoft.com/en-gb/azure/cost-management-billing/cost-management-billing-overview>

"For example, you might have signed up for Azure for your personal projects. So, you might have an individual Azure subscription with a billing account. You could also have access through your organization's Enterprise Agreement or Microsoft Customer Agreement. For each scenario, you would have a separate billing account."

upvoted 1 times

Question #317

Topic 1

HOTSPOT -

To complete the sentence, select the appropriate option in the answer area.

Hot Area:

Answer Area

Your Azure trial account expired last week.

You are now unable to

▼

Create additional Azure Active Directory (Azure AD) user accounts
start an existing Azure virtual machine
access your data stored in Azure
access the Azure portal

Answer Area

Your Azure trial account expired last week.

You are now unable to

▼

Create additional Azure Active Directory (Azure AD) user accounts
start an existing Azure virtual machine
access your data stored in Azure
access the Azure portal

Correct Answer:

A stopped (deallocated) VM is offline and not mounted on an Azure host server. Starting a VM mounts the VM on a host server before the VM starts. As soon as the VM is mounted, it becomes chargeable. For this reason, you are unable to start a VM after a trial has expired.

Incorrect Answers:

- You are not charged for Azure Active Directory user accounts so you can continue to create accounts.
- You can access data that is already stored in Azure.
- You can access the Azure Portal. You can also reactivate and upgrade the expired subscription in the portal.

- mtalex

Highly Voted

2 years ago

The answer is "You can't start an existing VM"

I have verified by loggin in to an account that has an expired subscription and I was able to access the data but not start a VM.

Question #318

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

Your company plans to purchase an Azure subscription.

The company's support policy states that the Azure environment must provide an option to access support engineers by phone or email.

You need to recommend which support plan meets the support policy requirement.

Solution: Recommend a Professional Direct support plan.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: A

The Basic support plan does not have any technical support for engineers.

The Developer support plan has only technical support for engineers via email.

The Standard, Professional Direct, and Premier support plans have technical support for engineers via email and phone.

read the question... that is not what it is asking. It is just asking if the Prof Direct plan would meet the goal of accessing support engineers by phone/email

upvoted 3 times
- examexpert**

3 years ago

It did not say anything about cost

upvoted 11 times
- Butabuta0925**

2 years ago

No. If it doesnt specify the cost and just if it is according to the Service Policy requirements, then the answer is clearly correct. There might be a thousand of other reasons why you are using a more expensive a plan and you just want to know if this specific service can be used or not

upvoted 3 times
- Jhill777**

Highly Voted

3 years, 4 months ago

Technically this is correct simply because it meets your goal and doesn't say anything about the cost. Per <https://azure.microsoft.com/en-us/support/plans/>, developer option does have access to email AND phone during business hours. Ergo, if question asked what is the cheapest, Developer would be the answer.

upvoted 13 times
- Jhill777**

3 years, 4 months ago

I read that wrong. Developer is only email. My bad. Standard would be cheapest and meet goal.

Question #319

Topic 1

Your company has a Software Assurance agreement that includes Microsoft SQL Server licenses.
You plan to deploy SQL Server on Azure virtual machines.
What should you do to minimize licensing costs for the deployment?

- A. Deallocate the virtual machines during off hours.
- B. Use Azure Hybrid Benefit.
- C. Configure Azure Cost Management budgets.
- D. Use Azure reservations.

Correct Answer: B

Azure Hybrid Benefit is a licensing benefit that helps you to significantly reduce the costs of running your workloads in the cloud. It works by letting you use your on-premises Software Assurance-enabled Windows Server and SQL Server licenses on Azure.

Question #320

Topic 1

Your company has 10 departments.

The company plans to implement an Azure environment.

You need to ensure that each department can use a different payment option for the Azure services it consumes.

What should you create for each department?

- A. a reservation
- B. a subscription
- C. a resource group
- D. a container instance

Correct Answer: B

There are different payment options in Azure including pay-as-you-go (PAYG), Enterprise Agreement (EA), and Microsoft Customer Agreement (MCA) accounts.

Your Azure costs are 'per subscription'. You are charged monthly for all resources in a subscription. Therefore, to use different payment options per department, you will need to create a separate subscription per department. You can create multiple subscriptions in a single Azure Active Directory tenant.

Incorrect Answers:

A: A reservation is where you commit to a resource (for example a virtual machine) for one or three years. This gives you a discounted price on the resource for the reservation period. Reservations do not provide a way to use different payment options per department.

C: A resource group is a logical container for Azure resources. You can view the total cost of all the resources in a resource group. However, resource groups do not provide a way to use different payment options per department.

D: A container instance is an Azure resource used to run an application. Container instances do not provide a way to use different payment options per department.

Question #322

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
An Azure service in private preview is released to all Azure customers.	☐	☐
An Azure service in public preview is released to all Azure customers.	☐	☐
An Azure service in general availability is released to a subset of Azure customers.	☐	☐

Answer Area**Statements****Yes****No**

An Azure service in private preview is released to all Azure customers.

☐☒

An Azure service in public preview is released to all Azure customers.

☒☐

An Azure service in general availability is released to a subset of Azure customers.

☐☒**Correct Answer:**

Box 1: No -

Most services go to private preview then public preview before being released to general availability. The private preview is only available to certain Azure customers for evaluation purposes.

Box 2: Yes -

Public Preview means that the service is in public beta and can be tried out by anyone with an Azure subscription. Services in public preview are often offered at a discount price.

Public previews are excluded from SLAs and in some cases, no support is offered.

Box 3: No -

An Azure service in general availability is available to all Azure customers, not just a subset of the customers.

"With a consumption-based plan, you reduce overall costs by paying only for extra capacity when it is required. "
<https://docs.microsoft.com/en-us/azure/architecture/framework/cost/design-price>
I am not sure of this: "Extra capacity". You pay for all capacity you use. Not just for any capacity in a consumption based plan.
So the answer should be B
upvoted 15 times

Highly Voted

2 years, 3 months ago

I agree with No, Yes, Yes but not for the argument given for the first question. It should be No, because a consumption Plan has nothing to do with data being send and retrieved from VM's, but rather it has to do with the execution time of (serverless) functions. Note that you still pay a price from data being send from storage, but thats not part of the 'consumption plan'.

Source: <https://docs.microsoft.com/en-us/azure/azure-functions/consumption-plan>
upvoted 9 times

  **Tin_Nguyen** 1 year, 5 months ago
I am still wondering: Since the consumption plan only charges us for the time the VMs is running. It has nothing to do with whether data is sent or not to the VMs. Doesn't that mean that the rate we are charged is fixed since fee is only dependent on the running time

SOLUTION: NO YES YES

CONSUMPTION MODEL: Users only pay for the resources that they use, no up-front costs. No need to purchase/manage costly infrastructure that not use fullest.

Ability to pay/stop paying for additional resources when needed.

No fixed rate for all data sends because resources are metered/billed according they consume.

SERVERLES COMPUTING: Highly scalable/event-driven, only resources when a specific function or trigger occurs.

upvoted 4 times

  **Huawei_55** 2 years, 4 months ago

Azure consumption based model is pay-as-you-go - You don't pay for data from on premises to Azure cloud ,but you only pay when that data is moved from azure to your data centre

upvoted 3 times

  **vr2021** 2 years, 4 months ago

Shouldn't the answer for 1 be 'Yes'? Isn't the price fixed?

Ans - YNN.
2nd - Azure Reservations are used to reserve capacity for specific Azure services and resources, but they do not reserve physical server capacity at a specified datacenter. Instead, they allow you to prepay for and reserve virtual machine (VM) instances or other Azure resources within a particular Azure region.
upvoted 3 times

  **Chantie_x** 2 months, 1 week ago
You can stop an Azure SQL Database instance to decrease cost - Yes

upvoted 6 times

  **Rajivjain** 3 months, 1 week ago
YNY
Agree NO : an Azure reservation is not used to reserve server capacity at a specific data center. Instead, it is used to reserve compute capacity in an Azure region or an Availability Zone for any duration of time1. By purchasing an Azure reservation, you can save money by committing to one-year or three-year plans for several Azure services.

Agree YES : Azure Sql database can be serverless and paused - when it's paused it most definitely reduces costs! I do that all the time for non-prod serverless.
upvoted 6 times

  **Saxman** 4 months, 1 week ago
Azure Sql database can be serverless and paused - when it's paused it most definately reduces costs! I do that all the time for non-prod serverless.

YYN is the answer.

<https://learn.microsoft.com/en-us/azure/cost-management-billing/reservations/manage-reserved-vm-instance>
If you bought Azure Reserved Virtual Machine Instances, you can change the optimize setting for the reservation. The reservation discount can apply to VMs in the same series or you can reserve data center capacity for a specific VM size. You should try to optimize reservations so that they're fully used.

upvoted 2 times

  **Pinha** 8 months, 2 weeks ago
2-yes

Azure reservations can be used to reserve capacity for Azure virtual machines (VMs) or other Azure resources, such as Azure SQL Database. When you make a reservation, you are committing to a certain level of usage over a period of time, usually one or three years. In return, you receive a discounted rate for the reserved capacity.

By reserving capacity, you can reduce your overall Azure costs, especially if you have a predictable workload that is expected to run consistently over a long period of time. Reservations can be made for both Windows and Linux VMs, as well as for other Azure resources like Azure SQL Database and Azure Cosmos DB.

upvoted 3 times

  **lombri** 8 months, 2 weeks ago
From documentation the only answer possible is ((YES NO NO))

Azure Database for MySQL - Only the compute costs are included with a reservation. A reservation doesn't cover software, networking, or storage charges associated with the MySQL Database server.

Y - Y - N

There is no way to stop SQL Azure Database to avoid billing charges when not in use. The azure virtual machine can be suspended and by doing that you can avoid hourly charges, but you cannot do the same with a SQL Azure Database which is charged hourly per database
upvoted 16 times

HOTSPOT -

To complete the sentence, select the appropriate option in the answer area.

Hot Area:

Answer Area

You have an application that is comprised of an Azure web app that has a Service Level Agreement (SLA) of 99.95 percent and an Azure SQL database that has an SLA of 99.99 percent.

The composite SLA for the application is

	▼
the product of both SLAs, which equals 99.94 percent	
the lowest SLA associated to the application, which is 99.95 percent	
the highest SLA associated to the application, which is 99.99 percent	
the difference between the two SLAs, which is 0.05 percent	

Correct Answer:

Answer Area

You have an application that is comprised of an Azure web app that has a Service Level Agreement (SLA) of 99.95 percent and an Azure SQL database that has an SLA of 99.99 percent.

The composite SLA for the application is

	▼
the product of both SLAs, which equals 99.94 percent	
the lowest SLA associated to the application, which is 99.95 percent	
the highest SLA associated to the application, which is 99.99 percent	
the difference between the two SLAs, which is 0.05 percent	

Composite SLAs involve multiple services supporting an application, each with differing levels of availability. For example, consider an App Service web app that writes to Azure SQL Database. At the time of this writing, these Azure services have the following SLAs:

App Service web apps = 99.95%

-
- SQL Database = 99.99%

What is the maximum downtime you would expect for this application? If either service fails, the whole application fails. The probability of each service failing is independent, so the composite SLA for this application is $99.95\% \times 99.99\% = 99.94\%$. That's lower than the individual SLAs, which isn't surprising because an application that relies on multiple services has more potential failure points.

Reference:

<https://docs.microsoft.com/en-us/azure/architecture/reliability/requirements#understand-service-level-agreements>

  **MCLC2021** Highly Voted 2 years, 3 months ago
The explanation has an error is not "-" is "x"

App Service web apps = 99.95%
SQL Database = 99.99%

The probability of each service failing is independent, so the composite SLA for this application is $99.95\% \times 99.99\% = 99.94\%$.

Question #326

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
The Service Level Agreement (SLA) guaranteed uptime for paid Azure services is at least 99.9 percent.	☐	☐
Companies can increase the Service Level Agreement (SLA) guaranteed uptime by adding Azure resources to multiple regions.	☐	☐
Companies can increase the Service Level Agreement (SLA) guaranteed uptime by purchasing multiple subscriptions.	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
The Service Level Agreement (SLA) guaranteed uptime for paid Azure services is at least 99.9 percent.	☒	☐
Companies can increase the Service Level Agreement (SLA) guaranteed uptime by adding Azure resources to multiple regions.	☒	☐
Companies can increase the Service Level Agreement (SLA) guaranteed uptime by purchasing multiple subscriptions.	☐	☒

Box 1: Yes -

SLA's vary based on the resource type and the location distribution of the resource. However, the minimum uptime for all Azure services is 99.9 percent.

Box 2: Yes -

The SLA guaranteed uptime is increased (usually to 99.95 percent) when resources are deployed across multiple regions.

Box 3: No -

The number of subscriptions is unrelated to uptime SLA's. You can deploy resources to multiple regions under a single subscription or you can have multiple subscriptions with resources deployed to the same region.

Reference:

<https://azure.microsoft.com/en-us/support/legal/sla/summary/>

🗨️ 👤 **foreverlearner** Highly Voted 3 years, 4 months ago

1) Yes - minimum guaranteed is 99.9%
2) Yes - Multiple AZ give you fault tolerance, Multiple regions give you Disaster Recovery. Should a whole region fail, it would take much longer to wait for it to come back, or redeploy everything in a new region, than already having the resources/services in said different region. Therefore, having services/resources span across multiple region CAN increase SLA (decrease downtime)
3) No - SLAs are for services, not subscriptions
upvoted 65 times

🗨️ 👤 **mrabello23** 3 years, 3 months ago

Second is NO. If you deploy services in multile regions without explicit activate AZ feature in the resource they will not increase anything.

Question #327

Topic 1

Which statement accurately describes the Modern Lifecycle Policy for Azure services?

- A. Microsoft provides mainstream support for a service for five years.
- B. Microsoft provides a minimum of 12 months' notice before ending support for a service.
- C. After a service is made generally available, Microsoft provides support for the service for a minimum of four years.
- D. When a service is retired, you can purchase extended support for the service for up to five years.

Correct Answer: B

For products governed by the Modern Lifecycle Policy, Microsoft will provide a minimum of 12 months' notification prior to ending support if no successor product or service is offered—excluding free services or preview releases.

Public preview – During this phase we allow any customer with the proper Azure AD license to evaluate the new feature. Microsoft Customer Support Services will supply support services during this phase, but normal service level agreements do not apply. For new features exposed in the Azure AD Portal, customer can expect to see information banners in the user interface that draw attention to the new experience available during the preview. By clicking on the information banner customers then opt-in to the preview experience.

When a service becomes generally available, Microsoft can still add new features. Think of it as updates
When you create Azure resources for a svc in public preview and then it becomes generally available you can still maintain the resources you first put in public preview. Its not like is going to be reset just bc it went to generally available. The whole idea of it is to test those "previews" to introduce them on our daily resources

Don't have the source but I see it more as logical

Question #332

Topic 1

Your company has an Azure subscription that contains the following unused resources:

- ⇒ 20 user accounts in Azure Active Directory (Azure AD)
- ⇒ Five groups in Azure AD
- ⇒ 10 public IP addresses
- ⇒ 10 network interfaces

You need to reduce the Azure costs for the company.

Which unused resources should you remove?

- A. the network interfaces
- B. the public IP addresses
- C. the groups
- D. the user accounts

Correct Answer: B

You are charged for public IP addresses. Therefore, deleting unused public IP addresses will reduce the Azure costs.

Reference:

<https://docs.microsoft.com/en-us/azure/advisor/advisor-cost-recommendations#reduce-costs-by-deleting-or-reconfiguring-idle-virtual-network-gateways>

Question #333

Topic 1

HOTSPOT -

To complete the sentence, select the appropriate option in the answer area.

Hot Area:

Answer Area

If an Azure virtual machine has a status of Stopped (deallocated), you will continue to pay for

compute capacity
I/O operations
networking
storage

Answer Area

Correct Answer:

If an Azure virtual machine has a status of Stopped (deallocated), you will continue to pay for

compute capacity
I/O operations
networking
storage

When a virtual machine is stopped (deallocated), the virtual machine is unloaded/dismounted from the physical server in Azure. In this state, you are not charged for the virtual machine itself. However, you are still charged for the storage costs of the virtual hard disks attached to the virtual machine.

If the virtual machine is stopped but not deallocated (this happens if you shut down the virtual machine from the operating system of the virtual machine), the virtual machine is still mounted on the physical server in Azure and you are charged for the virtual machine itself as well as the storage costs. To ensure that a virtual machine is 'stopped (deallocated)', you need to stop the virtual machine in the Azure portal.

Question #334

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Statements	Yes	No
Storing 1 TB of data in Azure Blob storage will always cost the same, regardless of the Azure region in which the data is located.	☐	☐
When you use a general-purpose v2 Azure Storage account, you are only charged for the amount of data that is stored. All read and write operations are free.	☐	☐
Transferring data between Azure Storage accounts in different Azure regions is free.	☐	☐

Correct Answer:

Statements	Yes	No
Storing 1 TB of data in Azure Blob storage will always cost the same, regardless of the Azure region in which the data is located.	☐	☒
When you use a general-purpose v2 Azure Storage account, you are only charged for the amount of data that is stored. All read and write operations are free.	☐	☒
Transferring data between Azure Storage accounts in different Azure regions is free.	☐	☒

Box 1: No -

The price of Azure storage varies by region. If you use the Azure storage pricing page, you can select different regions and see how the price changes per region.

Box 2: No -

You are charged for read and write operations in general-purpose v2 storage accounts.

Box 3: No -

You would be charge for the read operations of the source storage account and write operations in the destination storage account.

Storage account billing
You're billed for Azure Storage based on your storage account usage. All objects in a storage account are billed together as a group.
Storage costs are calculated according to the following factors:
Region refers to the geographical region in which your account is based.
Account type refers to the type of storage account you're using.
Access tier refers to the data usage pattern you've specified for your general-purpose v2 or Blob storage account.
Storage Capacity refers to how much of your storage account allotment you're using to store data.
Replication determines how many copies of your data are maintained at one time, and in what locations.
Transactions refer to all read and write operations to Azure Storage.
Data egress refers to any data transferred out of an Azure region. When the data in your storage account is accessed by an application that isn't running in the same region, you're charged for data egress.

Statements	Yes	No
In Azure Active Directory Premium P2, at least 99.9 percent availability is guaranteed.	☐	☐
The Service Level Agreement (SLA) for Azure Active Directory Premium P2 is the same as the SLA for Azure Active Directory Free.	☐	☐
All paying Azure customers receive a credit if their monthly uptime percentage is below the guaranteed amount in the Service Level Agreement (SLA).	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
In Azure Active Directory Premium P2, at least 99.9 percent availability is guaranteed.	☒	☐
The Service Level Agreement (SLA) for Azure Active Directory Premium P2 is the same as the SLA for Azure Active Directory Free.	☐	☒
All paying Azure customers receive a credit if their monthly uptime percentage is below the guaranteed amount in the Service Level Agreement (SLA).	☒	☐

Box 1: Yes -

Microsoft guarantee at least 99.9% availability of the Azure Active Directory Premium edition services. The services are considered available in the following scenarios:

- ⇒ Users are able to login to the service, login to the Access Panel, access applications on the Access Panel and reset passwords.
- ⇒ IT administrators are able to create, read, write and delete entries in the directory or provision or de-provision users to applications in the directory.

Box 2: No -

No SLA is provided for the Free tier of Azure Active Directory.

Box 3: Yes -

You can claim credit if the availability falls below the SLA. The amount of credit depends on the availability. For example: You can claim 25% credit if the availability is less than 99.9%, 50% credit for less than 99% and 100% for less than 95% availability.

🗄️ 👤 **Lanka22** 1 year ago

Sorry No answer is No

upvoted 1 times

🗄️ 👤 **zimzimzimma** 3 months, 2 weeks ago

Why? I checked the most recent SLA on <https://www.microsoft.com/licensing/docs/view/Service-Level-Agreements-SLA-for-Online-Services?lang=1>

and it has the same SLA for 'Azure Active Directory Basic and Azure Active Directory Premium'

Free and P2 aren't listed anymore. Answer to 2nd question should be YES.

upvoted 1 times

🗄️ 👤 **gabrysr1997** 1 year, 1 month ago

the answer for second question should be 'yes'

https://azure.microsoft.com/en-us/support/legal/sla/active-directory/v1_1/

just check 'sla details'

upvoted 2 times

🗄️ 👤 **JustSignalingVirtues** 1 year, 4 months ago

Basic is same as Free. You only have 3 tiers for Azure AD i.e, Free (Basic), P1, & P2. So, answers need to be adjusted accordingly.

upvoted 1 times

🗄️ 👤 **Kiwi28** 11 months, 1 week ago

Free was never Basic: <https://www.zdnet.com/article/microsoft-is-phasing-out-the-basic-edition-of-azure-active-directory/>

upvoted 1 times

🗄️ 👤 **JustSignalingVirtues** 1 year, 4 months ago

All 3 tiers of AAD has same availability.

BTW, SLA topics are removed from new exam as per the new objectives published on May 5th 2022.

upvoted 2 times

🗄️ 👤 **HananS** 1 year, 11 months ago

It is actually 99.99% available so the answer is N due to lack of one nine
upvoted 3 times

  **Algasibiur** 1 year, 10 months ago
Dude, it's says "At leat 99.9". That means >=99.9%.
According with Microsoft's SLA it's 99.99% and that mean that this question it's true.
<https://azure.microsoft.com/es-es/support/legal/sla/summary/>
upvoted 4 times

  **Saravana12g** 2 years, 3 months ago
Azure AD SLA has been revised:
We guarantee 99.99% availability of the Azure Active Directory Basic and Premium services.

Reference: https://azure.microsoft.com/en-in/support/legal/sla/active-directory/v1_1/
upvoted 4 times

  **catalene** 2 years, 3 months ago
this linl say "No SLA is offered for the Free edition of Azure Active Directory."
upvoted 2 times

  **Acai** 2 years, 2 months ago
Careful, It says in your link that no SLA is provided for the free tier
upvoted 1 times

  **flex2021** 2 years, 5 months ago
there is no SLA for free services so Q2 - NO
upvoted 2 times

  **Tomsss12345** 2 years, 5 months ago
SLA has been raised https://azure.microsoft.com/en-gb/support/legal/sla/active-directory/v1_1/
upvoted 3 times

  **xmd_5a** 2 years, 3 months ago
yeah! hence first question should be NO
upvoted 1 times

  **xhkgpkfrilchupiysb** 2 years ago
99.99 is still "at least 99.9" so I guess it can still be YES
upvoted 2 times

  **vajeje** 2 years, 6 months ago
Yes
YES - They actually changed it: <https://azure.microsoft.com/en-us/support/legal/sla/summary/>
yes
upvoted 4 times

  **Returner** 2 years, 6 months ago
From the link you provided, it is said "We guarantee at least 99.9% availability of the Azure Active Directory BASIC and PREMIUM services. No SLA is provided for the FREE tier of Azure Active Directory."
So the answer to the second one is NO.
upvoted 7 times

  **frack** 2 years, 2 months ago
at least 99.95%
upvoted 1 times

  **sinear** 2 years, 6 months ago
The question is again vague... you need to enter a claim if performance is below SLA, it won't be automatic. Si I would say NO to 3rd one.
upvoted 3 times

Question #336

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
Adding resource groups in an Azure subscription generates additional costs.	☐	☐
Copying 10 GB of data to Azure from an on-premises network over a VPN generates additional Azure data transfer costs.	☐	☐
Copying 10 GB of data from Azure to an on-premises network over a VPN generates additional Azure data transfer costs.	☐	☐

Answer Area

Statements	Yes	No
Adding resource groups in an Azure subscription generates additional costs.	☐	☒
Copying 10 GB of data to Azure from an on-premises network over a VPN generates additional Azure data transfer costs.	☐	☒
Copying 10 GB of data from Azure to an on-premises network over a VPN generates additional Azure data transfer costs.	☒	☐

Correct Answer:

Box 1: No -

Resource groups are logical containers for Azure resources. You do not pay for resource groups.

Box 2: No -

Data ingress over a VPN is data 'coming in' to Azure over the VPN. You are not charged data transfer costs for data ingress.

Box 3: Yes -

Data egress over a VPN is data 'going out' of Azure over the VPN. You are charged for data egress.

Reference:

<https://docs.microsoft.com/en-us/azure/azure-resource-manager/manage-resource-groups-portal> <https://azure.microsoft.com/en-us/pricing/details/bandwidth/>

Hot Area:

Answer Area

You deploy an Azure resource. The resource becomes unavailable for an extended period due to a service outage.

Microsoft will

refund your bank account.
migrate the resource to another subscription.
credit your Azure account.
send you a coupon code that you can redeem for Azure credits.

Correct Answer:

Answer Area

You deploy an Azure resource. The resource becomes unavailable for an extended period due to a service outage.

Microsoft will

refund your bank account.
migrate the resource to another subscription.
credit your Azure account.
send you a coupon code that you can redeem for Azure credits.

If the SLA for an Azure service is not met, you receive credits for that service and that service only. The credits are deducted from your monthly bill for that service.

If you stopped using the service where the SLA was not met, your account would remain in credit for that service. The credits would not be applied to any other services that you may be using.

Service Credits apply only to fees paid for the particular Service, Service Resource, or Service tier for which a Service Level has not been met. In cases where

Service Levels apply to individual Service Resources or to separate Service tiers, Service Credits apply only to fees paid for the affected Service Resource or

Service tier, as applicable. The Service Credits awarded in any billing month for a particular Service or Service Resource will not, under any circumstance, exceed your monthly service fees for that Service or Service Resource, as applicable, in the billing month.

Question #340

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
If your company uses an Azure free account, you will only be able to use a subset of Azure services.	☐	☐
All Azure free accounts expire after a specific period.	☐	☐
You can create up to 10 Azure free accounts by using the same Microsoft account.	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
If your company uses an Azure free account, you will only be able to use a subset of Azure services.	☐	☒
All Azure free accounts expire after a specific period.	☒	☐
You can create up to 10 Azure free accounts by using the same Microsoft account.	☐	☒

Box 1: No -

Azure Free Account gives you 12 months access to the most popular free services. It also gives you a credit (150 GBP or 200 USD) to use on any Azure service for up to 30 days.

Box 2: Yes -

All free accounts expire after 12 months.

Box 3: No -

You can only create one free Azure account per Microsoft account.

YYN

Yes, that's correct. Azure offers a free account option that allows users to try out various Azure services for free. However, this free account has certain limitations and restrictions, and it does expire after a specific period of time if you do not upgrade to a paid account. The Azure free account provides you with a limited amount of free services for 12 months, including access to popular Azure products such as Virtual Machines, App Service, and Storage. You also get free monthly credits to use toward other Azure services during that period. After the 12-month period, your account will be converted to a pay-as-you-go account, and you will be charged for any usage beyond the free services that were provided during the free trial. It's important to keep track of your usage and monitor your billing to avoid unexpected charges. If you continue to use Azure services beyond the free trial period, you will need to upgrade to a paid subscription plan to avoid service interruptions. Only one free account is allowed per microsoft account
upvoted 1 times

  **speedyweedy** 4 months, 3 weeks ago
First question is Yes

An Azure free account provides limited access to Azure services, and you can only use a subset of the available services. The purpose of the free account is to allow you to explore Azure and experiment with its services, without incurring any charges.

With an Azure free account, you get access to a limited set of Azure services, including some compute, storage, and networking services. You can also use some of the Azure services for free, but with certain usage limits. For example, you can use Azure Functions for free, but you have a monthly limit of 1 million requests and 400,000 GB-seconds of compute time.

If you need access to additional Azure services or want to use the services without any usage limits, you will need to upgrade to a paid Azure subscription.
upvoted 1 times

  **Rohit2023** 7 months ago
Answer should be:
Yes | Yes | No

First is Yes because when even you uses Free account/Trial account then you are not getting 100% of Azure services, you get most of Azure services but not all.

So out of 100 Azure services, you are getting 80-90 services so that means you are using a subset of Azure services, likewise if company uses same applies to them.

Note: Those who don't know the meaning of "Subset", google it once and you'll get to understand what I meant here. I learnt subset concept in Mathematics & maybe in Physics too.

  **ctxvad** 7 months, 2 weeks ago
First question should be Yes:
<https://azure.microsoft.com/en-ca/offers/ms-azr-0044p/>
With the Azure free account, eligible customers receive USD200 in credits which can be used within the first 30 days on most Azure services (NOT ALL).
upvoted 2 times

  **zelck** 8 months, 2 weeks ago
NYN is the answer.

<https://azure.microsoft.com/en-gb/free/free-account-faq>
There is a limit of one account with free services and USD200 credit per new customer.
upvoted 2 times

  **zelck** 8 months, 2 weeks ago
The Azure free account provides access to all Azure services and does not block customers from building their ideas into production. The Azure free account includes certain types of specific services—and certain amounts of those services—for free. To enable your production scenarios, you may need to use resources beyond the free amounts. If you choose to move to pay as you go, you'll be billed for those additional resources at pay-as-you-go rates.
upvoted 1 times

  **RougePotatoe** 8 months, 2 weeks ago
See the problem is there is no time frame associated with this question. For the first 30 days you get credits which will you to do whatever you want. But after 30 days you are limited to free services and free services that have usage constraints. In short Yes no restrictions for 1st 30 days but after 30 days there are constraints.
upvoted 2 times

  **zelck** 8 months, 2 weeks ago
<https://azure.microsoft.com/en-us/offers/ms-azr-0044p>
We offer eligible customers \$200 in Azure credits ("Credits") to be used within the first 30 days of sign-up and 12 months of select free services

(services subject to change). This offer is limited to one Azure free account per eligible customer and cannot be combined with any other offer unless otherwise permitted by Microsoft.

upvoted 1 times

  **zimzimzimma** 3 months, 2 weeks ago

"With the Azure free account, eligible customers receive USD200 in credits which can be used within the first 30 days on most Azure services."

  **akp1000** 1 year, 8 months ago

Y, N, N is the answer. Your account does not "expire", it is still there but your credit runs out.
upvoted 1 times

  **HT_TNT** 1 year, 6 months ago

Hey man, not correct, since it is confirmed that the free accounts expire after 12m.
upvoted 2 times

  **Harry28731** 1 year, 10 months ago

Again First question is poor wording. Normally it should be no as you can't buy everything even with the 200\$ credit and needs to go to a pay as u go, but it may not mean that you lose your free account....so basically from a marketing standpoint no one prevents you from accessing any services, just that you need to pay...even if it's a free account so NO
upvoted 1 times

Question #341

Topic 1

You have an Azure application that uses the services shown in the following table.

Service	Service Level Agreement (SLA)
Azure virtual machines	99.9%
Azure SQL Database	99.99%

How should you calculate the composite SLA for the application?

- A. $0.999 \times 0.9999 = 0.9989001 = 99.89001\%$
- B. $0.999 / 0.9999 = 0.9991 = 99.91\%$
- C. $\text{Max}(0.999, 0.9999) = 0.9999 = 99.99\%$
- D. $\text{Min}(0.999, 0.9999) = 0.999 = 99.9\%$

Correct Answer: A

Composite SLAs involve multiple services supporting an application, each with differing levels of availability. For example, consider an App Service web app that writes to Azure SQL Database. At the time of this writing, these Azure services have the following SLAs:

App Service web apps = 99.95%

SQL Database = 99.99%

What is the maximum downtime you would expect for this application? If either service fails, the whole application fails. The probability of each service failing is independent, so the composite SLA for this application is $99.95\% - 99.99\% = 99.94\%$. That's lower than the individual SLAs, which isn't surprising because an application that relies on multiple services has more potential failure points.

"Azure Spot VM instances" is the answer.

<https://learn.microsoft.com/en-us/azure/virtual-machines/spot-vms>
Using Azure Spot Virtual Machines allows you to take advantage of our unused capacity at a significant cost savings. At any point in time when Azure needs the capacity back, the Azure infrastructure will evict Azure Spot Virtual Machines. Therefore, Azure Spot Virtual Machines are great for workloads that can handle interruptions like batch processing jobs, dev/test environments, large compute workloads, and more.

Stop is de proper anwser to deallocate the resource and cost

upvoted 2 times
- akramul

5 months, 3 weeks ago

So far googling a lot and also got from chatGPT a well answer: To save on costs for an unused Azure virtual machine that runs Windows 10, you should select "stop" for the virtual machine from the Azure portal.

Stopping the virtual machine from the Azure portal will deallocate the compute resources, which will stop the accrual of charges for the virtual machine.

Shutting down the virtual machine from a Remote Desktop session will not deallocate the compute resources and will continue to accrue charges for the virtual machine.

So, it is recommended to use the Azure portal to stop the virtual machine to save on costs.

upvoted 3 times
- Sean_n3

6 months, 3 weeks ago

Deallocating a virtual machine stops the billing for the compute resources associated with the virtual machine while retaining the configuration and data associated with it. Here are the steps to deallocate an Azure virtual machine:

Open the Azure portal and go to the Virtual Machines page.

Select the virtual machine that you want to deallocate.

Click on the Stop button in the top menu. This will stop the virtual machine and deallocate its resources.

Once the virtual machine is stopped, you can start it again by clicking on the Start button in the top menu.

By deallocating the virtual machine, you can avoid paying for the compute resources that are not being used. However, keep in mind that you will still be charged for any storage resources associated with the virtual machine, such as disks and images. To save on these costs as well, you can consider deleting the virtual machine altogether, but this will also delete all of the data associated with it.

upvoted 2 times

🗨️ 👤 **ziggy1117** 6 months, 4 weeks ago

Stop from Azure Portal.

The second method, and the important one to remember, is to go into the Azure Portal (or use the Azure CLI or Azure PowerShell) and use Azure to Stop the VM. Instead of just shutting down the Operating System, Azure will also deallocate the compute resources allocated for the VM. This releases the compute resources to be used for another customer within Microsoft Azure. This will cause Azure to no longer charge you for the compute resources, and Azure will report the status of the VM as being in a "Stopped (Deallocated)" state.

<https://build5nines.com/properly-shutdown-azure-vm-to-save-money/>

upvoted 1 times

🗨️ 👤 **AlexKK** 6 months, 4 weeks ago

Shut down is the correct answer:

check this link: <https://learn.microsoft.com/en-us/azure/cost-management-billing/costs/tutorial-acm-opt-recommendations>

The list of recommendations identifies usage inefficiencies or shows purchase recommendations that can help you save additional money. The totaled Potential yearly savings shows the total amount that you can save if you shut down or deallocate all of your VMs that meet recommendation rules. If you don't want to shut them down, you should consider resizing them to a less expensive VM SKU.

Question #348

Topic 1

You have 1,000 virtual machines hosted on the Hyper-V hosts in a data center.

You plan to migrate all the virtual machines to an Azure pay-as-you-go subscription.

You need to identify which expenditure model to use for the planned Azure solution.

Which expenditure model should you identify?

- A. scalable
- B. operational
- C. elastic
- D. capital

Correct Answer: B

One of the major changes that you will face when you move from on-premises cloud to the public cloud is the switch from capital expenditure (buying hardware) to operating expenditure (paying for service as you use it). This switch also requires more careful management of your costs. The benefit of the cloud is that you can fundamentally and positively affect the cost of a service you use by merely shutting down or resizing it when it's not needed.

B is the answer.

upvoted 1 times
- zelck** 8 months, 1 week ago

<https://learn.microsoft.com/en-us/training/modules/describe-cloud-compute/6-describe-consumption-based-model>
In contrast, OpEx is spending money on services or products over time. Renting a convention center, leasing a company vehicle, or signing up for cloud services are all examples of OpEx.

Cloud computing falls under OpEx because cloud computing operates on a consumption-based model. With cloud computing, you don't pay for the physical infrastructure, the electricity, the security, or anything else associated with maintaining a datacenter. Instead, you pay for the IT resources you use. If you don't use any IT resources this month, you don't pay for any IT resources.

upvoted 1 times
- AzureCloud07** 9 months, 2 weeks ago

Operational Expenditure (OpEx): Money spent to use a service or a product
Zero upfront costs
You Pay for services as you use them (Pay-as-you-go model)
Example: Provisioning VMs as you need them
Example: Using Azure Functions and paying for invocations

Correct Answer:

Answer Area

Statements	Yes	No
A company has complete control of the resources and security for its private cloud.	☒	☐
A hybrid cloud solution enables a company to control whether its applications run on-premises or in the cloud.	☒	☐
Companies are responsible for capital expenditure when they scale up a virtual machine hosted in a public cloud.	☐	☒

  **kamal_004** Highly Voted 11 months ago

A company has complete control of the resources and security for its private cloud - Yes

A Hybrid Cloud solution enables a company to control whether its applications run on-premises or in the cloud - Yes

Explanation: Hybrid cloud computing enables an enterprise to deploy its most sensitive workloads in an on-premises cloud and to host less-critical resources on a third-party public cloud provider. This approach allows organizations to get the best of both private and public cloud models.

Companies are responsible for capital expenditure when they scale up a virtual machine hosted in a public cloud - No

Explanation: With the public cloud, you get pay-as-you-go pricing – you pay only for what you use, no CapEx costs.

Is this correct? Yes Yes No?

First one is grey, private cloud means it could be in a data center managed by a 3rd party so you wouldn't have complete control. NYN for me.

upvoted 2 times

  **RougePotatoe** 8 months, 2 weeks ago

Statement 1 is iffy.

A private cloud just means that the cloud is only dedicated to 1 company. It could be on the company's prem or it could be built and managed by a 3rd party vendor. So I would say No for statement 1. If I need to explain why a company don't have complete control over a 3rd party vendor that built and manages a private cloud you should probably fail.

Service Level Agreements not apply to public/private preview

Got this question on June 30, 2023

upvoted 1 times
- zellick

Selected Answer: A

8 months, 2 weeks ago

A is the answer.

<https://azure.microsoft.com/en-us/support/legal/preview-supplemental-terms>

Public preview – During this phase we allow any customer with the proper Azure AD license to evaluate the new feature. Microsoft Customer Support Services will supply support services during this phase, but normal service level agreements do not apply. For new features exposed in the Azure AD Portal, customer can expect to see information banners in the user interface that draw attention to the new experience available during the preview. By clicking on the information banner customers then opt-in to the preview experience.

upvoted 3 times
- zellick

8 months, 2 weeks ago

Azure services that are in public preview have a different SLA policy than services that are generally available (GA). Azure Services that are in public preview have different level of support, which may be less than the support level provided for GA services. And since not all services have the same requirements and complexity, each service will have its own SLA when it is in preview mode.

During the preview, it's typical that services not meet the same SLA as services that are in GA, it's intended for customers to test the services, provide feedback, and identify any issues that need to be addressed before the service is generally available.

It's important to consult the service documentation or communicate with the service team for the specific SLA for the service during its preview phase.

in Azure Firewall enables users on the internet to access a server on a virtual network.

RougePotatoe

Highly Voted

8 months, 1 week ago

Lol I love questions that basically ask you to pick a fruit, options are orange and apple.

Without NAT you cannot convert private IP to public IP.
Without a network rule to enable traffic, all traffic is implicitly denied, so you need to create an allow rule to communicate with your server.

upvoted 9 times

zimzimzima

Love the analogy. But yeah, it's pretty sad.

upvoted 1 times

zelck

Most Recent

8 months, 1 week ago

"NAT rules" is the answer.

<https://learn.microsoft.com/en-us/azure/firewall/policy-rule-sets#dnat-rules>
DNAT rules allow or deny inbound traffic through the firewall public IP address(es). You can use a DNAT rule when you want a public IP address to be translated into a private IP address. The Azure Firewall public IP addresses can be used to listen to inbound traffic from the Internet, filter the traffic and translate this traffic to internal resources in Azure.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
The cost of outbound traffic from Azure is the same for all Azure regions.	☐	☐
Purchasing Azure services through an Enterprise Agreement (EA) requires you to spend a predetermined amount.	☐	☐
Microsoft defines the pricing structure of all third-party services sold through Azure Marketplace.	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
The cost of outbound traffic from Azure is the same for all Azure regions.	☐	☒
Purchasing Azure services through an Enterprise Agreement (EA) requires you to spend a predetermined amount.	☒	☐
Microsoft defines the pricing structure of all third-party services sold through Azure Marketplace.	☒	☐

Box 1: No -

Within most of the areas, there are clearly more expensive regions and less expensive regions.

The least expensive regions, on average across these instance types are us-west-2, us-west-central, and korea-south.

The most expensive regions are asia-pacific-east, japan-east, and australia-east.

Box 2: Yes -

Many organizations with Microsoft Enterprise Agreements (EA) are adding Azure to their EA to enjoy the benefits it offers, such as:

Minimizing Azure upfront costs by locking in pricing with consumption pre-commitment

Using Azure EA Portal to manage Azure Subscriptions easily and organize them under a single billing account

Box 3: Yes -

Hot Area:

Answer Area

Statements	Yes	No
Pay-As-You-Go (PAYG) is a consumption-based model.	☐	☐
Payments to cloud service providers are considered capital expenditures (CapEx).	☐	☐
The services provided through a consumption-based model are considered operational expenditures (OpEx).	☐	☐

Correct Answer:**Answer Area**

Statements	Yes	No
Pay-As-You-Go (PAYG) is a consumption-based model.	☒	☐
Payments to cloud service providers are considered capital expenditures (CapEx).	☐	☒
The services provided through a consumption-based model are considered operational expenditures (OpEx).	☒	☐

Box 1: Yes -

The Pay as You Go model is billed on a per second basis and you can start or stop the service at any time æ" paying only for what you use.

Box 2: No -

No, it is OpEx (Operational Expenditures).

OpEx: The business can achieve ROI immediately in many cases because the infrastructure is managed by the cloud provider.

CapEx: ROI is not usually realized until a long time after the purchase was made because the infrastructure needs to be set up and employees need to be trained.

Computers, servers, and other hardware needed for on-premises data centers are all examples of CapEx.

Box 3: Yes -

Operational Expenditures (OpEx) are the ongoing costs related to day-to-day operations. A subscription fee for cloud services is considered OpExæ"the cloud provider is making the infrastructure investment upfront, and you only pay for the resources you need as you need them.

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
All Azure services in private preview must be accessed by using a separate Azure portal.	☐	☐
Azure services in public preview can be used in production environments.	☐	☐
Azure services in public preview are subject to a Service Level Agreement (SLA).	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
All Azure services in private preview must be accessed by using a separate Azure portal.	☐	☒
Azure services in public preview can be used in production environments.	☒	☐
Azure services in public preview are subject to a Service Level Agreement (SLA).	☐	☒

Public Preview means that the service is in public beta and can be tried out by anyone with an Azure subscription. Services in public preview are often offered at a discount price.

Box 1: No -

Services in private preview can be viewed in the regular Azure portal. However, you need to be signed up for the feature in private preview before you can view it.

Access to private preview features is usually by invitation only.

Box 2: Yes -

You can use services in public preview in production environments. However, you should be aware that the service may have faults, is not subject to an SLA and may be withdrawn without notice.

Box 3: No -

Public previews are excluded from SLAs and in some cases, no support is offered.

Basically they let you not to follow the best practices, open up the security holes and be non-compliant in production environment. What's the point of all the compliances, security and other BSs?

upvoted 2 times

🗨️ 👤 **Ankit776** 2 years, 8 months ago

Public preview – During this phase we allow any customer with the proper Azure AD license to evaluate the new feature. Microsoft Customer Support Services will supply support services during this phase, but normal service level agreements do not apply. For new features exposed in the Azure AD Portal, customer can expect to see information banners in the user interface that draw attention to the new experience available during the preview. By clicking on the information banner customers then opt-in to the preview experience.

upvoted 1 times

🗨️ 👤 **AbhiYad** 2 years, 8 months ago

Public preview - its just for feedback and use by all people. SLA applicable only for GA editions.

upvoted 1 times

🗨️ 👤 **Santhip** 2 years, 8 months ago

Azure preview portal is different to azure portal. First answer is "yes"

upvoted 1 times

🗨️ 👤 **Massy** 2 years, 7 months ago

but the services in preview are also in the "normal" portal... the preview portal is only for the preview of the portal, so the first answer is no.

upvoted 2 times

🗨️ 👤 **NS_19** 1 year, 11 months ago

Previews of new Azure services should show up in both portal.azure.com and preview.portal.azure.com.

upvoted 1 times

Your company has 10 offices. You plan to generate several billing reports from the Azure portal. Each report will contain the Azure resource utilization of each office.

Which Azure Resource Manager feature should you use before you generate the reports?

- A. tags
- B. templates
- C. locks
- D. policies

Correct Answer: A

You can use resource tags to 'label' Azure resources. Tags are metadata elements attached to resources. Tags consist of pairs of key/value strings. In this question, we would tag each resource with a tag to identify each office. For example: Location = Office1. When all Azure resources are tagged, you can generate reports to list all resources based on the value of the tag. For example: All resources used by Office1.

References:

<https://docs.microsoft.com/en-us/azure/cloud-adoption-framework/decision-guides/resource-tagging/>

Community vote distribution

Kashh Highly Voted 3 years, 8 months ago

After you apply tags, you can retrieve all the resources in your subscription with that tag name and value. Tags enable you to retrieve related resources from different resource groups. This approach is helpful when you need to organize resources for billing or management.

upvoted 7 times

zelck 8 months, 2 weeks ago

Selected Answer: A
A is the answer.

<https://learn.microsoft.com/en-us/azure/azure-resource-manager/management/tag-resources?tabs=json#tags-and-billing>
You can use tags to group your billing data. If you're running multiple VMs for different organizations, for example, use the tags to group usage by cost center. You can also use tags to categorize costs by runtime environment, such as the billing usage for VMs running in the production environment.
upvoted 1 times

zelck 8 months, 2 weeks ago

<https://learn.microsoft.com/en-us/training/modules/describe-cost-management-azure/7-describe-purpose-of-tags>
Resource tags are another way to organize resources. Tags provide extra information, or metadata, about your resources. This metadata is useful for:
- Cost management and optimization Tags enable you to group resources so that you can report on costs, allocate internal cost centers, track budgets, and forecast estimated cost.

Question #358

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
A Standard support plan is included in an Azure free account.	☐	☐
A Premier support plan can only be purchased by companies that have an Enterprise Agreement (EA).	☐	☐
Support from MSDN forums is only provided to companies that have a pay-as-you-go subscription.	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
A Standard support plan is included in an Azure free account.	☐	☒
A Premier support plan can only be purchased by companies that have an Enterprise Agreement (EA).	☒	☐
Support from MSDN forums is only provided to companies that have a pay-as-you-go subscription.	☐	☒

Box 1: No -
An Azure free account comes with a 'basic' support plan, not a 'standard' support plan.

Box 2: Yes -
You can purchase the Professional Direct, Standard, and Developer support plans with the Microsoft Customer Agreement. You can also purchase the Professional and Standard support plans with the Enterprise Agreement.

Box 3: No -
Users with any type of Azure subscription (pay-as-you-go, Enterprise Agreement, Microsoft Customer Agreement etc.) can get support from the MSDN forums.

References:

Highly Voted 

 3 years, 4 months ago

1) No - you get Basic support
2) Yes - <https://azure.microsoft.com/en-gb/support/plans/> - "You can purchase the Professional Direct, Standard and Developer support plans with the Microsoft Customer Agreement. [...] Enterprise Agreement (EA) customers can purchase Azure Standard, ProDirect and Premier technical support through their Reseller. Developer Support is not available through an Enterprise Agreement." So you can't purchase Premier with an MCA, you would need an EA
3) No - any plan has access to it
upvoted 78 times
-   nav777 1 year, 8 months ago

Ans is Correct. But Just FYI -

Microsoft Premier Support End of Sale date

As of July 1, 2021, Microsoft will no longer enter into Premier Support agreements for new customers. Beginning July 1, 2022, Microsoft will no longer offer Premier Support agreements for renewing customers.

Please note, Premier Support is still available for public sector customers who have not yet transitioned to Unified Support. This announcement currently does not impact government organizations, academic and non-profit institutions who have not yet transitioned to Unified Support. Premier Support for Partners will not be impacted.

Premier Support is being replaced by Unified Support which provides comprehensive support coverage across your entire organization to help drive the outcomes you need most. With Unified Support you gain a mix of personalized and on-demand services, including assistance from a designated account manager and proactive services to advance your digital transformation. Learn more about Unified Support.

Question #359

Topic 1

This question requires that you evaluate the underlined text to determine if it is correct.

If Microsoft plans to end support for an Azure service that does NOT have a successor service, Microsoft will provide notification at least 12 months before.

Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed`. If the statement is incorrect, select the answer choice that makes the statement correct.

- A. No change is needed.
- B. 6 months
- C. 90 days
- D. 30 days

Correct Answer: A

The Modern Lifecycle Policy covers products and services that are serviced and supported continuously. For products governed by the Modern Lifecycle Policy,

Microsoft will provide a minimum of 12 months' notification prior to ending support if no successor product or service is offered—excluding free services or preview releases.

Question #360

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
A user who is assigned the Owner role can transfer ownership of an Azure subscription.	☐	☐
You can convert the Azure subscription of your company from Free Trial to Pay-As-You-Go.	☐	☐
The Azure spending limit is fixed and cannot be increased or decreased.	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
A user who is assigned the Owner role can transfer ownership of an Azure subscription.	☐	☒
You can convert the Azure subscription of your company from Free Trial to Pay-As-You-Go.	☒	☐
The Azure spending limit is fixed and cannot be increased or decreased.	☒	☐

Box 1: No -

You need to be an administrator of the billing account that has the subscription to be able to transfer the subscription. This could be a Billing Administrator or Global Administrator. A subscription owner can manage all resources and permissions within the subscription but cannot transfer ownership of the subscription.

Box 2: Yes -

You can convert a free trial subscription to Pay-As-You-Go. This is common practice for people who wish to continue using the Azure services when the free trial period expires.

Box 3: Yes -

You can remove the spending limit, but you can't increase or decrease it.

The spending limit in Azure prevents spending over your credit amount. All new customers who sign up for an Azure free account or subscription types that include credits over multiple months have the spending limit turned on by default. The spending limit is equal to the amount of credit and it can't be changed. For example, if you signed up for Azure free account, your spending limit is \$200 and you can't change it to \$500. However, you can remove the spending limit. So, you either have no limit, or you have a limit equal to the amount of credit.

Reference:

<https://docs.microsoft.com/en-us/azure/billing/billing-add-change-azure-subscription-administrator> <https://docs.microsoft.com/en-us/azure/billing/billing-upgrade-azure-subscription> <https://docs.microsoft.com/en-us/azure/billing/billing-spending-limit>

 **jprmartinho** Highly Voted 2 years, 7 months ago

Given answer is correct.

- "Only the billing administrator of an account can transfer ownership of a subscription."

  **mpooja**  2 years, 3 months ago

Appeared in 05 - Jun -21 Exam

upvoted 8 times

  **speedyweedy**  4 months, 2 weeks ago

Third is Yes

The Azure spending limit is not fixed and can be increased or decreased by the account administrator. The spending limit is a feature in Azure that allows administrators to set a budget cap on their Azure usage. When the spending limit is reached, Azure will restrict further usage of the service until the limit is increased or the billing period ends.

To increase or decrease the spending limit in Azure, the account administrator can follow these steps:

1. Sign in to the Azure portal using their credentials.
2. Navigate to the "Cost Management + Billing" blade and select the subscription they want to modify.
3. Click on the "Spending limit" link and enter the new spending limit value.
4. Click on the "Save" button to apply the new spending limit.

upvoted 1 times

  **leirem** 2 months ago

based on your explanation you mean NO right?

upvoted 2 times

  **speedyweedy** 4 months, 2 weeks ago

First is Yes, a user who is assigned the Owner role in an Azure subscription can transfer ownership of that subscription to another user or group.

The Owner role has full access to the subscription and can perform administrative tasks, including transferring ownership.

To transfer ownership of an Azure subscription, the user with the Owner role needs to perform the following steps:

1. Sign in to the Azure portal using their credentials.
2. Navigate to the "Subscriptions" blade and select the subscription they want to transfer ownership of.
3. Click on the "Change owner" button and enter the email address of the new owner.
4. Select the new owner from the list of available users or groups.
5. Click on the "OK" button to complete the transfer.

Once ownership of the subscription has been transferred, the new owner will have full access to the subscription and can perform administrative tasks just like the previous owner.

upvoted 2 times

  **kazan** 8 months, 1 week ago

Answer is correct

You can't change the amount of the spending limit. For example, if you signed up for Azure free account, your spending limit is \$200 and you can't change it to \$500. However, you can remove the spending limit. So, you either have no limit, or you have a limit equal to the amount of credit

upvoted 1 times

  **RougePotatoe** 8 months, 2 weeks ago

Soo statement 3 is complicated.

"So, you either have no limit, or you have a limit equal to the amount of credit. The limit prevents you from most kinds of spending."

<https://learn.microsoft.com/en-us/azure/cost-management-billing/manage/spending-limit>

I looked up if you could buy azure credits to increase your credits. Turns out you can. So that would mean you can increase the credits thus increasing the limit.

<https://azure.microsoft.com/en-us/offers/ms-azr-0111p/>

upvoted 1 times

  **zelck** 8 months, 3 weeks ago

NYT is the answer.

<https://learn.microsoft.com/en-us/azure/cost-management-billing/manage/billing-subscription-transfer>

Only the billing administrator of an account can transfer ownership of a subscription.

<https://learn.microsoft.com/en-us/azure/cost-management-billing/manage/spending-limit#remove-the-spending-limit-in-azure-portal>

The spending limit in Azure prevents spending over your credit amount. All new customers who sign up for an Azure free account or subscription types that include credits over multiple months have the spending limit turned on by default. The spending limit is equal to the amount of credit.

You can't change the amount of the spending limit. For example, if you signed up for Azure free account, your spending limit is \$200 and you can't change it to \$500. However, you can remove the spending limit. So, you either have no limit, or you have a limit equal to the amount of credit. The limit prevents you from most kinds of spending.

Question #361

Topic 1

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
With Azure Reservations, you pay less for virtual machines than with pay-as-you-go pricing.	☐	☐
Two Azure virtual machines that use the B2S size have the same monthly costs.	☐	☐
When an Azure virtual machine is stopped, you continue to pay storage costs for the virtual machine.	☐	☐

Correct Answer:

Answer Area

Statements	Yes	No
With Azure Reservations, you pay less for virtual machines than with pay-as-you-go pricing.	☒	☐
Two Azure virtual machines that use the B2S size have the same monthly costs.	☐	☒
When an Azure virtual machine is stopped, you continue to pay storage costs for the virtual machine.	☒	☐

Box 1: Yes -

A reservation is where you commit to pay for a resource (for example a virtual machine) for one or three years. This gives you a discounted price on the resource for the reservation period.

Box 2: No -

There are other factors that influence the cost of a virtual machine such as the virtual hard disks attached to the virtual machine. You could have multiple virtual machines with the same 'size' (B2S in this case) but with different virtual hard disk configurations.

Box 3: Yes -

When a virtual machine is stopped (deallocated), the virtual machine is unloaded/dismounted from the physical server in Azure. In this state, you are not charged for the virtual machine itself. However, you are still charged for the storage costs of the virtual hard disks attached to the virtual machine.

If the virtual machine is stopped but not deallocated (this happens if you shut down the virtual machine from the operating system of the virtual machine), the virtual machine is still mounted on the physical server in Azure and you are charged for the virtual machine itself as well as the storage costs. To ensure that a virtual machine is 'stopped (deallocated)', you need to stop the virtual machine in the Azure portal.

For question 1: You will not necessarily pay less. It depends on how much you use. You pay a lower rate with a reservation. However, if your usage is very low, you'd pay less with pay-as-you-go.

Question #362

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen. Your company has an Azure subscription that contains the following unused resources:

- ⇒ 20 user accounts in Azure Active Directory (Azure AD)
- ⇒ Five groups in Azure AD
- ⇒ 10 public IP addresses
- ⇒ 10 network interfaces

You need to reduce the Azure costs for the company.

Solution: You remove the unused network interfaces.

Does this meet the goal?

A. Yes

B. No

Correct Answer: B

You are not charged for unused network interfaces. Therefore, deleting unused network interfaces will not reduce the Azure costs for the company.

upvoted 1 times

🗨️ 👤 **Marcacal** 4 months, 2 weeks ago

Yes, removing the unused network interfaces can help reduce Azure costs for the company. Network interfaces are charged based on the number of hours they exist, regardless of their association with a virtual machine. So removing unused network interfaces can help reduce costs.

So the correct answer to your question is A. Yes.

Question #363

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

Your company has an Azure subscription that contains the following unused resources:

- 20 user accounts in Azure Active Directory (Azure AD)

Five groups in Azure AD -

-
- 10 public IP addresses
- 10 network interfaces

You need to reduce the Azure costs for the company.

Solution: You remove the unused public IP addresses.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: A

You are charged for public IP addresses. Therefore, deleting unused public IP addresses will reduce the Azure costs.

Azure AD free provide management of users and groups

Azure AD P1 provide support of dynamic groups

upvoted 1 times

  **Gwak** 2 years, 9 months ago

I guess A. They just said Azure AD. not mentioned P1 P2 or OFFICE 365 APPS

upvoted 2 times

  **PosPunk** 3 years ago

You delete the account but you already have the license, don't you?

upvoted 1 times

  **Enoll** 2 years, 11 months ago

Yes but it doesn't mention a license here - just user account. If you have just an account that doesn't have a license, you can keep it at no cost, deleting it will not save money (because it is just an account, not a license). If it was delete unused license, then it will be YES, this will save money.

upvoted 1 times

  **carecajo** 3 years ago

B - answer should NO

Customers are not charged for a MAU's subsequent authentications or for storing inactive users within that calendar month.

<https://azure.microsoft.com/it-it/pricing/details/active-directory/external-identities/>
upvoted 4 times

  **gelato** 3 years, 3 months ago

Based on the discussion the question should have stated what's in unused AD user accounts.
upvoted 1 times

  **Rooks** 3 years, 5 months ago

As long as there's no license assignment to those users then there's no cost with those users ..

Question #365

Topic 1

HOTSPOT -

How should you calculate the monthly uptime percentage? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

▼

÷

▼

×

▼

Downtime in Minutes	60	100
Maximum Available Minutes	1,440	99.99
(Maximum Available Minutes – Downtime in Minutes)	Maximum Available Minutes	1.440

Correct Answer:

Answer Area

▼

÷

▼

×

▼

Downtime in Minutes	60	100
Maximum Available Minutes	1,440	99.99
(Maximum Available Minutes – Downtime in Minutes)	Maximum Available Minutes	1.440

"Maximum Available Minutes" is the total accumulated minutes during a billing month .

"Downtime" is the total accumulated minutes that are part of Maximum Available Minutes where a system is unavailable.

"Monthly Uptime Percentage" for a service is calculated as Maximum Available Minutes less Downtime divided by Maximum Available Minutes x 100.

Monthly Uptime Percentage is represented by the following formula:

Monthly Uptime % = (Maximum Available Minutes-Downtime) / Maximum Available Minutes x 100.

Reference:

https://azure.microsoft.com/en-au/support/legal/sla/cloud-services/v1_0/

- Ikrom

Highly Voted

3 years, 8 months ago

"Monthly Uptime Percentage" for Virtual Machines in Availability Zones is calculated as Maximum Available Minutes less Downtime divided by Maximum Available Minutes in a billing month for a given Microsoft Azure subscription. Monthly Uptime Percentage is represented by the following formula:

Monthly Uptime % = (Maximum Available Minutes – Downtime) / Maximum Available Minutes X 100

upvoted 55 times
- mytapun

2 years, 9 months ago

exactly

upvoted 2 times
- JimmyYop

Highly Voted

2 years, 3 months ago

Simple Math. Lets Say your VM in Azure is active for 60 minutes per day in a 30 day month, so Maximum Available Minutes = 60*30=1800 if your VM has an outage for 60 minutes then

Downtime = 60

Using the Formula for

Monthly Uptime % = (Maximum Available Minutes – Downtime) / Maximum Available Minutes X 100

Monthly Uptime % = (1800-60)/1800 * 100 = 96.66%

MSFT is offering SLA's which include a guaranteed uptime. How do you get your money back? If you can prove that MSFT has not fulfilled the SLA, for this you need to be able to calculate your uptime.
Does it make sense?
upvoted 1 times
-   **VIP_G** 1 year, 6 months ago
If you cannot solve this simple equation and do not like math, you should probably not be getting into tech... just saying... logic is a must in tech.
upvoted 1 times

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
By creating additional resource groups in an Azure subscription, additional costs are incurred.	☐	☐
By copying several gigabits of data to Azure from an on-premises network over a VPN, additional data transfer costs are incurred.	☐	☐
By copying several GB of data from Azure to an on-premises network over a VPN, additional data transfer costs are incurred.	☐	☐

Correct Answer:**Answer Area**

Statements	Yes	No
By creating additional resource groups in an Azure subscription, additional costs are incurred.	☐	☒
By copying several gigabits of data to Azure from an on-premises network over a VPN, additional data transfer costs are incurred.	☐	☒
By copying several GB of data from Azure to an on-premises network over a VPN, additional data transfer costs are incurred.	☒	☐

Box 1: No -

Resource groups are logical containers for Azure resources. You do not pay for resource groups.

Box 2: No -

Data ingress over a VPN is data 'coming in' to Azure over the VPN. You are not charged data transfer costs for data ingress.

Box 3: Yes -

Data egress over a VPN is data 'going out' of Azure over the VPN. You are charged for data egress.

Reference:

<https://docs.microsoft.com/en-us/azure/azure-resource-manager/manage-resource-groups-portal> <https://azure.microsoft.com/en-us/pricing/details/bandwidth/> <https://azure.microsoft.com/en-us/pricing/details/bandwidth/>

Question #367

Topic 1

This question requires that you evaluate the underlined text to determine if it is correct.

A support plan solution that gives you best practice information, health status and notifications, and 24/7 access to billing information at the lowest possible cost is a Standard support plan.

Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed`. If the statement is incorrect, select the answer choice that makes the statement correct.

- A. No change is needed
- B. Developer
- C. Basic
- D. Premier

Correct Answer: C

A basic support plan provides:

24x7 access to billing and subscription support, online self-help, documentation, whitepapers, and support forums

Best practices: Access to full set of Azure Advisor recommendations

Health Status and Notifications: Access to personalized Service Health Dashboard & Health API

Question #368

Topic 1

In which Azure support plans can you open a new support request?

- A. Premier and Professional Direct only
- B. Premier, Professional Direct, and Standard only
- C. Premier, Professional Direct, Standard, and Developer only
- D. Premier, Professional Direct, Standard, Developer, and Basic

Correct Answer: D

You can submit support request tickets in the following plans: Premier, Professional Direct, Standard, Developer, and Basic.

Reference:

<https://azure.microsoft.com/en-us/support/plans/>

Community vote distribution

D (83%)

C (17%)

-   **Kaavie**

Highly Voted 

 3 years, 9 months ago

correct answer should be D. due to Basic plan only cannot create Technical support, others are OK.

upvoted 58 times
-   **sbettani** 3 years, 9 months ago

No, correct answer is C, you can open a Technical support only with Premier, Professional Direct, Standard, and Developer , read <https://azure.microsoft.com/en-us/support/plans/>

upvoted 31 times
-   **Rooks** 3 years, 5 months ago

This is a bit tricky..

The question is asking about Support Requests and not Technical Support or Who can open cases.

And the support plans article says the below

Scope

Available to all Microsoft Azure accounts. That is including Basic.

So answer could be all but not sure of what they are actually asking..

upvoted 25 times
-   **Fosnefes** 7 months, 3 weeks ago

I agree. However regarding Basic the support is only for Billing and Account.

upvoted 1 times
-   **newbie** 11 months ago

thanks..

upvoted 1 times
-   **silvia497** 3 years ago

But it doesn't say anything about being a technical support, it says service request which is available to Basic too.

<https://azure.microsoft.com/en-us/support/plans/>

upvoted 4 times
-   **ConaxLearn** 3 years, 1 month ago

Question does not say to open a technical support request.

And the Azure support plan page says "Ability to submit as many support tickets as you need" under Basic plan.

<https://azure.microsoft.com/en-us/support/plans/>

Quote "can you open a new support request?" there's nothing in the question to state it's technical. And even in the free account i can do a support request to upgrade. => D

upvoted 29 times

  **Marcal** Most Recent 4 months, 2 weeks ago

You can open a new support request with a Premier, Professional Direct, Standard, and Developer support plan. The Basic support plan does not include the ability to open a new support request for technical support 1. The correct answer is C. Premier, Professional Direct, Standard, and Developer only.

upvoted 1 times

  **speedyweedy** 4 months, 3 weeks ago

Selected Answer: D

All Azure support plans allow you to open support tickets with Microsoft. However, the level of support you receive may vary depending on the plan you have.

Here is a summary of the support plans and the level of support they provide:

- 1. Basic: Provides 24/7 technical support for Azure portal and billing issues through online and email channels, but does not provide a guaranteed response time for support tickets.
- 2. Developer: Provides standard technical support for Azure issues during business hours, with a guaranteed initial response time of 12 hours for support tickets.
- 3. Standard: Provides standard technical support for Azure issues 24/7, with a guaranteed initial response time of 1 hour for critical issues and 4 hours for non-critical issues.
- 4. Professional Direct: Provides personalized technical support with a dedicated technical account manager and faster response times than the standard plan.
- 5. Premier: Provides the highest level of technical support with a dedicated support team, personalized service, and faster response times than the other plans.

upvoted 1 times

  **K2001** 1 year, 1 month ago

I have read many of the discussions on questions where the answer I believed to be correct and the supplied answer were at odds, and been impressed with the cogent reasoning and responses. And yet, in the end, I am still left in doubt as to which answer will score me a point on the exam, as too many of these discussions are not about the features and functions of Azure, and which are best suited to which scenario, but arguments about how to correctly interpret the question . It just seems like it doesn't matter how much you actually know about Azure, if you are unfortunate enough to get too many of these badly designed questions, you are still reduced to guessing at the answer. I don't know if Microsoft think they are being clever doing this, or they just don't care that the questions are bad, but either way, it reduces what should be a test of knowledge, to a game show farce.

Question #369

Topic 1

This question requires that you evaluate the underlined text to determine if it is correct.

You can create an Azure support request from support.microsoft.com.

Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed.` If the statement is incorrect, select the answer choice that makes the statement correct.

- A. No change is needed.
- B. the Azure portal
- C. the Knowledge Center
- D. the Security & Compliance admin center

Correct Answer: B

You can create an Azure support request from the Help and Support blade in the Azure portal or from the context menu of an Azure resource in the Support + Troubleshooting section.

Question #370

Topic 1

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen. Your company has an Azure subscription that contains the following unused resources:

- ⇒ 20 user accounts in Azure Active Directory (Azure AD)
- ⇒ Five groups in Azure AD
- ⇒ 10 public IP addresses
- ⇒ 10 network interfaces

You need to reduce the Azure costs for the company.

Solution: You remove the unused groups.

Does this meet the goal?

A. Yes

B. No

Correct Answer: B

You are not charged for Azure Active Directory Groups. Therefore, deleting unused groups will not reduce your Azure costs.

Reference:

<https://docs.microsoft.com/en-us/azure/advisor/advisor-cost-recommendations#reduce-costs-by-deleting-or-reconfiguring-idle-virtual-network-gateways>

Selected Answer: B

B is the answer.
upvoted 2 times

🗲️ 👤 **zelck** 8 months, 2 weeks ago

Removing the unused groups in Azure AD will not significantly reduce the Azure costs for the company, as groups are a low-cost resource in Azure.

To reduce Azure costs, you should consider removing or deallocating other unused resources that are more costly, such as the 20 user accounts in Azure AD, the 10 public IP addresses, and the 10 network interfaces. Removing or deallocating these resources can help to reduce the Azure costs for the company.

upvoted 1 times

🗲️ 👤 **TonyghostR05** 11 months, 2 weeks ago

You need to read the question carefully. This user is using subscription plan, therefore, delete any group is no effect about the cost. Correct Ans is remove public IP address
upvoted 1 times

🗲️ 👤 **iedodo** 1 year, 6 months ago

Since AD is tied to licences, both the idea of removing unused Groups and Account won't impact the cost, meaning the IP addresses still sounds the best option

upvoted 5 times

Question #371

Topic 1

This question requires that you evaluate the underlined text to determine if it is correct.

The Azure Standard support plan is the lowest cost option to receive 24x7 access to support engineers by phone.

Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed`. If the statement is incorrect, select the answer choice that makes the statement correct.

- A. No change is needed
- B. Developer
- C. Basic
- D. Professional Direct

Correct Answer: A

The Basic support plan is free so is therefore the cheapest. The Developer support plan is the cheapest paid-for support plan. The order of support plans in terms of cost ranging from the cheapest to most expensive is: Basic, Developer, Standard, Professional Direct, Premier. However, 24/7 access to technical support by email and phone is only available for Standard, Professional Direct, Premier plans.

"Azure TCO calculator" is the answer.

<https://learn.microsoft.com/en-us/training/modules/describe-cost-management-azure/3-compare-pricing-total-cost-of-ownership-calculators>
The TCO calculator is designed to help you compare the costs for running an on-premises infrastructure compared to an Azure Cloud infrastructure. With the TCO calculator, you enter your current infrastructure configuration, including servers, databases, storage, and outbound network traffic. The TCO calculator then compares the anticipated costs for your current environment with an Azure environment supporting the same infrastructure requirements.

Selected Answer: D

Azure Advisor provides recommendations to help align your company's cloud usage with industry standard best practices. Azure Advisor is a free Azure service that analyzes your resource usage and configurations, and provides personalized recommendations to help optimize your resources for high availability, security, performance, and cost.
Azure Advisor's recommendations are based on Microsoft's experience with running large-scale cloud services and industry best practices. The recommendations cover a wide range of topics, such as optimizing virtual machine configurations, improving network security, and reducing unnecessary costs.
By following Azure Advisor's recommendations, you can help ensure that your company's cloud usage aligns with industry standards and that your resources are optimized for performance, security, and cost-effectiveness. Additionally, Azure Advisor provides a dashboard that helps you track the progress of your recommendations and measure the impact of implementing the recommended changes.

Question #375

Topic 1

You need to start Azure Cloud Shell.

What should you use?

- A. the Azure portal
- B. Azure Command-Line Interface (CLI)
- C. Azure PowerShell
- D. an Azure Resource Manager (ARM) template

Correct Answer: A

Community vote distribution

A (100%)

🗲️ 👤 **Rohit2023** 7 months, 1 week ago

Selected Answer: A

Portal is only used when you want Azure Cloud shell.

upvoted 2 times

🗲️ 👤 **zellck** 8 months, 3 weeks ago

Selected Answer: A

A is the answer.

<https://learn.microsoft.com/en-us/azure/cloud-shell/overview>

Azure Cloud Shell is an interactive, authenticated, browser-accessible shell for managing Azure resources. It provides the flexibility of choosing the shell experience that best suits the way you work, either Bash or PowerShell.

You can access Cloud Shell in three ways:

- Direct link: Open a browser to <https://shell.azure.com>.
- Azure portal: Select the Cloud Shell icon on the Azure portal
- Code samples: In Microsoft technical documentation and training resources, select the Try It button that appears with Azure CLI and Azure PowerShell code snippets

Selected Answer: A

A is the answer.

<https://learn.microsoft.com/en-us/azure/storage/common/storage-redundancy#locally-redundant-storage>
Locally redundant storage (LRS) replicates your storage account three times within a single data center in the primary region. LRS provides at least 99.999999999% (11 nines) durability of objects over a given year.

upvoted 3 times
- zelck

8 months, 2 weeks ago

An Azure Storage account that uses locally-redundant storage (LRS) maintains three copies of data to provide high availability and durability.

LRS is a feature of Azure Storage that replicates data within a single region to protect against potential hardware failures or data center outages. When you enable LRS for your storage account, Azure automatically replicates your data within the same region to three different storage clusters, which are located in separate fault domains.

With LRS, you get three copies of your data within the same region, which helps to ensure that your data is available and protected against potential disasters or outages.

LRS is typically used to protect data that does not require the highest level of durability or availability, such as test or development data. It is one of the replication options available for Azure Storage accounts, along with geo-redundant storage (GRS) and zone-redundant storage (ZRS).

upvoted 2 times
- zelck

D is the answer.

upvoted 3 times

  **zelck** 8 months, 2 weeks ago

Agility is the ability of a cloud service to adapt quickly to changing requirements and scale up or down as needed to meet the demands of a workload.

In a cloud environment, agility is enabled by the ability to quickly provision and de-provision resources, as well as the ability to scale resources up or down as needed. This allows a cloud service to respond quickly to changes in workload demand, such as sudden spikes in traffic or new business requirements.

Agility is an important characteristic of cloud services, as it enables organizations to be more flexible and responsive to changing business needs. It also allows organizations to optimize their resources and reduce costs by only using the resources that they need, when they need them.

- zelck

8 months, 2 weeks ago

Vertical scaling, also known as scaling up or scaling out, is the process of increasing the capacity of a single resource, such as a virtual machine or a database, to meet the demands of a workload. This can be done by adding more resources to the existing resource, such as additional CPUs, memory, or storage.

An example of vertical scaling in a cloud environment is adding an additional CPU to an existing Azure virtual machine. This can be done by modifying the VM's size or configuration to include more CPUs, which will allow it to handle a larger workload or more concurrent requests.

Other examples of vertical scaling in a cloud environment include adding more memory to a database server, or increasing the capacity of a storage volume.

Vertical scaling is typically used to address short-term or temporary increases in workload demand, and is often a faster and simpler way to scale a resource than horizontal scaling, which involves adding additional instances of a resource.

upvoted 2 times
- TomGa

9 months ago

Selected Answer: A

Vertical scaling is adding more resources to existing VMs. Horizontal is when you add more VMs, to you existing VM count essentially spreading out.

  **speedyweedy** 4 months, 2 weeks ago

Third is Yes

Microsoft Defender for Cloud (formerly known as Azure Defender) provides a Regulatory Compliance dashboard that allows you to assess your compliance with various industry and regulatory standards, such as ISO 27001, NIST SP 800-53, PCI DSS, and HIPAA. The Regulatory Compliance dashboard provides a summary of your compliance status, including the number of controls that are in place, the number of controls that are not in place, and the number of controls that are being monitored. You can drill down into each standard to see the specific controls that are required and the status of each control.
In addition to the dashboard, you can also download a Regulatory Compliance report that provides a detailed view of your compliance posture. The report includes a summary of your compliance status, a list of controls that are required, and a list of controls that are in place or not in place. It also includes recommendations for improving your compliance posture and a roadmap for achieving compliance.
upvoted 1 times

  **speedyweedy** 4 months, 2 weeks ago

Second is No

No, Microsoft Defender for Cloud (formerly known as Azure Defender) is not a free service. It is available as a paid add-on to Azure services and requires an Azure subscription.
The pricing for Microsoft Defender for Cloud is based on the number and type of resources you want to protect, as well as the level of support you require. Microsoft offers several pricing tiers to suit different needs and budgets, ranging from a free trial for 30 days to a pay-as-you-go model and an annual subscription with a discounted rate.

It's worth noting that some Microsoft Defender for Cloud features are included with certain Azure services, such as Azure Security Center, which provides basic security management and threat protection for Azure resources at no additional cost. However, to access the full range of Microsoft Defender for Cloud features, you will need to subscribe to the service and pay the associated fees.
upvoted 1 times

  **speedyweedy** 4 months, 2 weeks ago

First is Yes,

Microsoft Defender for Cloud (formerly known as Azure Defender) is a cloud-native security solution that provides threat protection for various Azure resources, such as virtual machines, virtual networks, storage accounts, and Azure Kubernetes Service (AKS) clusters. It also provides protection for certain on-premises resources, such as servers and virtual machines, through the use of the Microsoft Defender for Endpoint agent. By monitoring your Azure resources and on-premises resources, Microsoft Defender for Cloud can detect and respond to threats quickly, helping you to secure your infrastructure and data. It uses advanced analytics and machine learning to identify suspicious activities and potential threats, and provides you with actionable insights and recommendations to help you prevent and mitigate security incidents.
upvoted 1 times

  **[Removed]** 4 months, 2 weeks ago

Yes, Microsoft Defender for Cloud can monitor Azure resources and on-premises resources.

No, not all Microsoft Defender for Cloud features are free. Some features may require additional licensing or subscription.

Yes, you can download a Regulatory Compliance report for Microsoft Defender for Cloud. The report includes information about compliance with various regulations and standards, such as GDPR, ISO 27001, and HIPAA.

Yes-No-Yes. Cloud has less configuration options in PaaS and SaaS, for example.
upvoted 2 times

  **speedyweedy** 4 months, 2 weeks ago

Second is No

Cloud computing and on-premises deployments are two different deployment models with different characteristics. While there may be some similarities in terms of configuration options, they are not identical.

In on-premises deployments, organizations typically have full control over their hardware and software configurations, which allows for a greater degree of customization and flexibility. However, this also requires significant upfront investments in hardware and infrastructure, as well as ongoing maintenance and upgrades.

Cloud computing, on the other hand, provides a more flexible, scalable and cost-effective alternative to on-premises deployments. Cloud providers offer a wide range of configuration options, but they may not always be identical to those available in on-premises environments. For example, some hardware and software configurations that are possible in on-premises deployments may not be available in the cloud, while cloud providers may offer additional configuration options that are not available on-premises.

upvoted 2 times

  **Rohit2023** 7 months, 1 week ago

  **kazan** 8 months, 1 week ago

Y?Y. Depends what they mean by configuration options. So ? for 2nd part.

upvoted 1 times

  **hundredsandthousands** 8 months, 2 weeks ago

YNY - thinking of on-premise legacy solutions, some can't be replicated into the cloud (ie: only runs on non-compliant older Operating Systems, etc)

upvoted 2 times

  **azirila** 8 months, 2 weeks ago

answer is correct!

Explanation:

Capital expenditures (CapEx) are funds used by a company to acquire, upgrade, and maintain physical assets such as property, plants, buildings, technology, or equipment. These costs are lower in cloud computing than in on-premises deployments.

Cloud computing in general provides the same configuration options as on-premises deployments. If you compare a specific product such as Exchange Online vs. Exchange Server or Azure SQL vs. SQL Server this might not be true. But, you could install Exchange Server on a virtual machine in the cloud to get the same configuration options.

Cloud computing allows to increase or decrease IT resources as needed to meet changing demand. Scalability is one of the hallmarks of the cloud and the primary driver of its exploding popularity with businesses.

An Azure virtual machine (VM) requires a virtual network to function properly. A virtual network is a logical network in Azure that provides networking services to Azure resources, such as virtual machines, web apps, and databases.

A virtual network allows you to create a private network in Azure and connect it to your on-premises network, if you have one. It provides a secure and isolated environment for your Azure resources to communicate with each other and access the internet.
upvoted 3 times

  **TomGa** 9 months ago

Selected Answer: A

A virtual network is a prerequisite to create an Azure VM. Is that the confusion - if so none of the other answers are required for a functioning VM.

Azure Functions is the new kid on the block in the Azure platform. It's a key ingredient of serverless compute that's needed to achieve the benefits of a cloud PaaS implementation. Azure Functions turns the focus to the value of the code and away from managing infrastructure.

upvoted 1 times
- [Removed]

4 months, 2 weeks ago

Yes, Azure Functions is an example of a cloud service that can be classified as both a Platform-as-a-Service (PaaS) and a Function-as-a-Service (FaaS) model.

As a PaaS model, Azure Functions provides a platform for developers to deploy and manage their serverless applications without having to worry about the underlying infrastructure. Azure Functions abstracts away the underlying servers, storage, and networking, and allows developers to focus on their code and business logic.

As a FaaS model, Azure Functions allows developers to write and deploy small, event-driven functions that automatically scale and run in response to incoming events or triggers. These functions are billed based on their execution time and the resources used during that time.

Therefore, Azure Functions is an example of a cloud service that can be classified as both a PaaS and a FaaS model, depending on the context in which it is being used.

So the answer is Y Y Y.
upvoted 3 times
- speedyweedy

4 months, 3 weeks ago

YYY

Azure Functions is a serverless compute platform that allows you to build event-driven applications without worrying about the underlying infrastructure. You simply write your code and deploy it to Azure Functions, and the platform takes care of everything else, including scaling up or down to handle the required workload. This makes Azure Functions a great choice for building microservices, APIs, and other types of applications that require rapid scaling and high availability.
In summary, Azure Functions is a PaaS offering from Microsoft that provides a serverless compute platform for building and running event-driven applications in the cloud.

2 months, 1 week ago

Selected Answer: C

6 of course. Three in each region. How can we crowdsource a better set of updated answers?

upvoted 2 times
- speedyweedy

4 months, 3 weeks ago

Selected Answer: C

An Azure Storage account that uses geo-redundant storage (GRS) maintains six copies of your data. With GRS, Azure replicates your data to a secondary region that's hundreds of miles away from the primary region where the data is stored. In the secondary region, Azure creates three additional copies of your data, which brings the total number of copies to six. This provides an additional layer of protection for your data in case of a major disaster or outage that affects the primary region. If such an event occurs, Azure automatically fails over to the secondary region and makes your data available from there.

upvoted 2 times
- salim_

5 months, 3 weeks ago

Selected Answer: C

Geo-redundant storage (GRS) copies your data synchronously three times within a single physical location in the primary region using LRS. It then copies your data asynchronously to a single physical location in a secondary region.

3 times in primary LRS + 3 times in secondary LRS = 6

🗨️ **MightyLeschow** 8 months, 1 week ago

A.
Because it is an geo-redundant storage (GRS) = 3, not a geo-redundant zone (GZRS) which synchronously replicate your data partial in the different availability zone in other region - 6
upvoted 1 times

🗨️ **zellick** 8 months, 1 week ago

both GRS and GZRS has 6 copies.

<https://learn.microsoft.com/en-us/azure/storage/common/storage-redundancy#redundancy-in-a-secondary-region>

Azure Storage offers two options for copying your data to a secondary region:

- Geo-redundant storage (GRS) copies your data synchronously three times within a single physical location in the primary region using LRS. It then copies your data asynchronously to a single physical location in the secondary region. Within the secondary region, your data is copied synchronously three times using LRS.
- Geo-zone-redundant storage (GZRS) copies your data synchronously across three Azure availability zones in the primary region using ZRS. It then copies your data asynchronously to a single physical location in the secondary region. Within the secondary region, your data is copied synchronously three times using LRS.

upvoted 2 times

🗨️ **MightyLeschow** 8 months, 1 week ago

so the GRS offer 4 whole files copy? because you cannot consider partially as whole , because as stated in GRS its copy your data asynchronously to a SINGLE physical location in the secondary region, isn't it ?
upvoted 1 times

🗨️ **zellick** 8 months ago

Selected Answer: C

C is the answer.

<https://learn.microsoft.com/en-us/azure/storage/common/storage-redundancy#redundancy-in-a-secondary-region>

Geo-redundant storage (GRS) copies your data synchronously three times within a single physical location in the primary region using LRS. It then copies your data asynchronously to a single physical location in the secondary region. Within the secondary region, your data is copied synchronously three times using LRS.

upvoted 1 times

  **zelck** 8 months, 2 weeks ago

An Azure Storage account that uses geo-redundant storage (GRS) maintains six copies of data to provide high availability and durability.

GRS is a feature of Azure Storage that provides data replication across two regions, which are typically hundreds of miles apart. When you enable GRS for your storage account, Azure automatically replicates your data to a secondary region, which serves as a backup in case of a disaster or regional outage.

With GRS, you get three copies of your data in the primary region and three copies in the secondary region. This provides a total of six copies of your data, which helps to ensure that your data is available and protected against potential disasters or outages.

GRS is typically used to protect mission-critical data that requires high availability and durability, such as business-critical applications, financial records, and customer data. It is one of the replication options available for Azure Storage accounts, along with locally redundant storage (LRS) and zone-redundant storage (ZRS).

upvoted 1 times

  **zelck** 8 months, 2 weeks ago

<https://learn.microsoft.com/en-us/training/modules/describe-azure-storage-services/3-redundancy>

GRS copies your data synchronously three times within a single physical location in the primary region using LRS. It then copies your data asynchronously to a single physical location in the secondary region (the region pair) using LRS. GRS offers durability for Azure Storage data objects of at least 16 nines (99.99999999999999%) over a given year.

B is the answer.

<https://learn.microsoft.com/en-us/azure/virtual-desktop/rbac>
Azure Virtual Desktop uses Azure role-based access control (RBAC) to control access to resources. There are a number of built-in roles for use with Azure Virtual Desktop which is a collection of permissions. You assign roles to users and admins and these roles give permission to carry out certain tasks.

upvoted 4 times

👤

zelck

8 months, 2 weeks ago

In Azure, you can use role-based access control (RBAC) to grant permissions to Azure Virtual Desktop resources. RBAC is a system that allows you to manage access to Azure resources based on roles.

In RBAC, you can define roles that represent a set of permissions, and then assign those roles to users or groups. For example, you can create a role that allows users to view and manage Azure Virtual Desktop resources, and then assign that role to a group of users who need to access those resources.

Can two Virtual Networks under the same subscription have the same CIDR blocks (10.0.0.0/ 16)?

Ans. Yes, you can have two Virtual Networks with the same address space under the same subscription.

But the address space of the First virtual network(10.0.0.0/ 16) will overlaps with the address space of the second virtual network(10.0.0.0/ 16), Virtual Networks with overlapping address space cannot be peered. If you intend to peer these virtual networks, change address space.

"High availability, Geo-distribution, Scalability" is the answer.
upvoted 2 times

zelck

8 months, 1 week ago

<https://learn.microsoft.com/en-us/training/modules/describe-benefits-use-cloud-services/2-high-availability-scalability-cloud>

High availability
When you're deploying an application, a service, or any IT resources, it's important the resources are available when needed. High availability focuses on ensuring maximum availability, regardless of disruptions or events that may occur.

Scalability
Another major benefit of cloud computing is the scalability of cloud resources. Scalability refers to the ability to adjust resources to meet demand. If you suddenly experience peak traffic and your systems are overwhelmed, the ability to scale means you can add more resources to better handle the increased demand.

<https://learn.microsoft.com/en-us/training/modules/describe-cloud-service-types/4-describe-software-service>
The shared responsibility model applies to all the cloud service types. SaaS is the model that places the most responsibility with the cloud provider and the least responsibility with the user. In a SaaS environment you're responsible for the data that you put into the system, the devices that you allow to connect to the system, and the users that have access. Nearly everything else falls to the cloud provider. The cloud provider is responsible for physical security of the datacenters, power, network connectivity, and application development and patching.

upvoted 2 times

👤

zelck

8 months, 2 weeks ago

Software as a service (SaaS) is a cloud service model that allows customers to access and use software applications over the internet. In the SaaS model, the provider is responsible for managing and maintaining the infrastructure, software, and data associated with the application. The customer pays a subscription fee to use the software and does not need to worry about installing, configuring, or maintaining the software.

SaaS minimizes the management responsibility of the customer, as the provider handles most of the management tasks, such as provisioning, scaling, patching, and updating the software. This allows the customer to focus on using the software to meet their business needs, rather than worrying about the underlying infrastructure.

"elasticity" is the answer.
upvoted 8 times

  **zelck** 8 months, 1 week ago
<https://azure.microsoft.com/en-us/resources/cloud-computing-dictionary/what-is-elastic-computing/>
Elastic computing is the ability to quickly expand or decrease computer processing, memory, and storage resources to meet changing demands without worrying about capacity planning and engineering for peak usage. Typically controlled by system monitoring tools, elastic computing matches the amount of resources allocated to the amount of resources actually needed without disrupting operations. With cloud elasticity, a company avoids paying for unused capacity or idle resources and doesn't have to worry about investing in the purchase or maintenance of additional resources and equipment.

  **speedyweedy** 4 months, 3 weeks ago
NNY

Archive access tier cannot be set at the account level in Azure Storage. The Archive tier is a storage class that can be set at the blob level within a storage account, but not at the account level.
The Archive access tier in Azure Storage offers the lowest cost for storing blobs among the three access tiers: Hot, Cool, and Archive. The Archive access tier is designed for data that is rarely accessed and can tolerate several hours of retrieval latency. It has the lowest storage costs among the three access tiers, but higher data retrieval costs and longer retrieval times. This makes it a good choice for data that is seldom accessed and can tolerate longer retrieval times.
The access tier of a storage account can be changed at any time, and it applies to all blobs within the account that have not had their access tier explicitly set. Changing the access tier of a storage account affects all blobs that do not have an explicit access tier set, including those that were uploaded prior to the change
upvoted 3 times

  **Sean_n3** 6 months, 3 weeks ago
it should be NYY, chatGPT says the second one The cool access tier offers the lowest costs for storing blobs in azure storage
Yes, that's correct! The Cool access tier is one of the three access tiers offered by Azure Blob Storage, and it is designed for data that is infrequently accessed and stored for at least 30 days.
upvoted 2 times

  **ziggy1117** 6 months, 4 weeks ago
N, N, Y.. Archive can only be set at the blob level
upvoted 1 times

  **XtraWest** 7 months, 1 week ago
N, N, Y
As per Chat GPT: No, the Archive access tier for Azure storage cannot be set at the account level. It can only be set at the container or blob level. Each blob within a container can have its own access tier, so you have the flexibility to set different access tiers for different blobs within the same container.
upvoted 3 times

  **Rohit2023** 7 months, 2 weeks ago
NNY

Only the Hot and Cool access tiers can be set at the account level. The Archive access tier can only be set at the blob level.
From Azure docs: The Archive tier is not supported as the default access tier for a storage account.

Correct

Azure Queue storage is a fully managed, cloud-based message queue service.

Azure Files allows you to create file shares in the cloud that can be accessed by both Windows and Linux clients over the SMB (Server Message Block) protocol.

upvoted 5 times
- Rezaparsa

Most Recent

8 months, 3 weeks ago

I think the answer is correct

Azure Queue Storage is a service for storing large numbers of messages. You access messages from anywhere in the world via authenticated calls using HTTP or HTTPS. A queue message can be up to 64 KB in size. A queue may contain millions of messages, up to the total capacity limit of a storage account. Queues are commonly used to create a backlog of work to process asynchronously

Statements	Yes	No
Premium storage accounts can be configured as Azure file shares.	☒	☐
Premium storage accounts can be configured as block blobs storage.	☒	☐
Premium storage accounts can be configured as StorageV2 storage.	☐	☒

- Pinha

Highly Voted

8 months, 2 weeks ago

1: True.
Premium storage accounts provide high-performance storage for Azure virtual machines. Using premium storage accounts to create file shares can provide better performance and increased reliability compared to standard storage accounts.

2: True.
Block blobs are used to store unstructured data, such as text and images, and can be up to 4.75 TB in size. Using premium storage accounts for block blobs can provide better performance and increased reliability compared to standard storage accounts.

3: False.
Premium storage accounts cannot be configured as a storageV2 storage accounts. StorageV2 storage account is a new version of General purpose storage accounts, that provide all the features of the General purpose v1 and additional features and capabilities such as larger file shares, higher IOPS and throughput, and archive storage tier.

premium storage accounts can be configured as StorageV2 accounts in Azure. StorageV2 is the latest version of Azure Storage and provides a number of advanced features such as support for hierarchical namespaces, Azure AD-based authentication, and more. Premium storage accounts are optimized for high-performance workloads and offer higher IOPS and throughput compared to standard storage accounts. They are ideal for scenarios that require low latency and high throughput, such as running databases or virtual machines in the cloud. By configuring premium storage accounts as StorageV2 accounts, you can take advantage of the advanced features provided by StorageV2 while also benefiting from the high-performance capabilities of premium storage accounts. This can help you optimize your cloud infrastructure for performance, scalability, and cost-effectiveness.

Question #401

Topic 1

What should you use to prevent traffic from an Azure virtual network from being routed to an Azure Storage account via the internet?

- A. a network security group (NSG)
- B. a public endpoint
- C. Azure VPN Gateway
- D. a service endpoint

Correct Answer: A

Community vote distribution

D (76%)

A (24%)

- Ciupaz

Highly Voted

8 months, 3 weeks ago

Selected Answer: A

A is correct, because with the security rules of NSG you can permit /deny traffic inbound /outbound.
upvoted 8 times
- speedyweedy

Highly Voted

4 months, 3 weeks ago

Selected Answer: D

I also believe D is correct since it is the best and first preferred option in the given scenario (A is second preferred option)
To prevent traffic from an Azure virtual network from being routed to an Azure Storage account via the internet, you can use the following steps:
1. Create a virtual network service endpoint for Azure Storage: This will allow traffic to Azure Storage to be routed directly from the virtual network to the storage account, without going over the internet.
2. Configure network security group rules: You can configure network security group rules to block traffic from the virtual network to the internet. This will prevent any traffic that is not explicitly allowed from leaving the virtual network.
3. Configure storage account firewall and virtual network settings: You can configure the storage account firewall to only allow traffic from the virtual network, and configure the virtual network settings to only allow traffic to the storage account through the virtual network service endpoint.
upvoted 7 times
- aws_arn_name

2 months, 2 weeks ago

Your comment say service endpoint will allow traffic be routed directly from the virtual network to the storage account but it not prevent traffic be routed through internet. To prevent it , u still need step 2 to Configure network security group rules

Selected Answer: D

To prevent traffic from an Azure virtual network from being routed to an Azure Storage account via the internet, you should use a service endpoint. Azure virtual networks enable you to create a private network in the cloud. Azure Storage is a cloud-based storage solution provided by Microsoft Azure.

upvoted 2 times
- Daniel_marakero

1 month, 3 weeks ago

I think the right answer is C - Azure VPN Gateway, since the question refers to prevent traffic for an Azure Virtual Network via the internet, so the key word here is Internet, since a definition for a VPN Gateway is this: VPN gateway sends encrypted traffic between your virtual network and your on-premises location across a public connection (this is Internet)
upvoted 1 times
- Daniel_marakero

1 month, 3 weeks ago

reading the question very carefully, says that should you use to prevent traffic from an Azure virtual network from being routed to an Azure Storage account. Clearly talks about a connection between 2 Azure resources, in one hand we have Azure Virtual Network meanwhile in the other hand we have an Azure Storage Account. So checking the definition for NSG it says: You can use an Azure network security group to filter network traffic to and from Azure resources in an Azure virtual network. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources.
For that reason, I change my answer to A - Network Security Group.
Check it out this link: <https://learn.microsoft.com/en-us/azure/virtual-network/network-security-group-how-it-works>
upvoted 2 times
- Andrew_S

2 months, 1 week ago

Selected Answer: A

I think the hint is "prevent" as an active statement. Of course, a service endpoint is also good, but the NSG can prevent the internet access, where a service endpoint may still permit a public endpoint as well.

Virtual Network (VNet) service endpoint provides secure and direct connectivity to Azure services over an optimized route over the Azure backbone network. Endpoints allow you to secure your critical Azure service resources to only your virtual networks. Service Endpoints enables private IP addresses in the VNet to reach the endpoint of an Azure service without needing a public IP address on the VNet.

Selected Answer: D

D. a service endpoint

After analyzing the answers from various sources, got to a point that "Service Endpoint" is the answer.

As when enabling Service Endpoint, traffic is routed from Microsoft Backbone and the Internet traffic is blocked.

upvoted 4 times

  **tmusayev** 7 months, 3 weeks ago

Selected Answer: D

D. a service endpoint

Service endpoints are a feature of Azure that allow you to secure access to a resource, such as an Azure Storage account, from a virtual network. When you enable a service endpoint for a resource, traffic from the virtual network to the resource is forced to stay within the Microsoft Azure backbone network, preventing it from being routed over the internet.

A service endpoint provides a direct connection from the virtual network to the Azure service over the Microsoft Azure backbone network. This eliminates exposure to the public internet and reduces the threat of data exposure or theft. Service endpoints also provide better security, improved performance, and reduced latency compared to using a public endpoint.

Question #402

Topic 1

Which service can replace a resource lock automatically if the lock is removed?

- A. Azure Information Protection (AIP)
- B. Azure Blueprints
- C. Azure Backup
- D. Azure Advisor

Correct Answer: B

Community vote distribution

B (100%)

- gilldilraj

6 months ago

b. Azure Blueprints can automatically replace a resource lock if it is removed.

upvoted 1 times
- BeauChateau

6 months, 1 week ago

Selected Answer: B

B. Azure Blueprints

Azure Blueprints can replace a resource lock automatically if the lock is removed. A resource lock is a setting that you apply to a resource to prevent accidental deletion or modification of the resource. When a lock is applied to a resource, it blocks any operations that would modify or delete the resource.

If a resource lock is removed, it can leave the resource vulnerable to accidental deletion or modification. However, if the resource is associated with an Azure Blueprint, the Blueprint can automatically replace the lock to help protect the resource. This is because Azure Blueprints enforce compliance with policies and standards across multiple subscriptions, environments, and regions.

upvoted 2 times
- zelck

8 months, 2 weeks ago

Selected Answer: B

B is the answer.

<https://learn.microsoft.com/en-us/azure/governance/blueprints/concepts/resource-locking#overriding-locking-states>
It's typically possible for someone with appropriate Azure role-based access control (Azure RBAC) on the subscription, such as the 'Owner' role, to be allowed to alter or delete any resource. This access isn't the case when Azure Blueprints applies locking as part of a deployed assignment. If the assignment was set with the Read Only or Do Not Delete option, not even the subscription owner can perform the blocked action on the protected resource.

This security measure protects the consistency of the defined blueprint and the environment it was designed to create from accidental or programmatic deletion or alteration.

upvoted 4 times
- zelck

8 months, 2 weeks ago

Azure Blueprints is a service that allows you to define a set of Azure resources that implement and adhere to an organization's standards, patterns, and requirements. You can use Azure Blueprints to create a repeatable, predictable, and auditable way to build and manage Azure environments.

One of the features of Azure Blueprints is the ability to apply resource locks to prevent unauthorized changes to your resources. A resource lock is a way to prevent accidental or unauthorized deletion, modification, or movement of a resource.

If a resource lock is removed, Azure Blueprints can automatically replace the lock to ensure that your resources remain protected. This helps to prevent accidental or unauthorized changes to your resources, and ensures that your environments remain compliant with your organizational standards and requirements.

upvoted 4 times
- zelck

Sa_Msa 5 months, 3 weeks ago

No it's correct, it should be Subscriptions.

See below from this link: <https://learn.microsoft.com/en-us/partner-center/assign-azure-subscriptions>

Assign Azure subscriptions to your customers
To assign an Azure subscription to a customer, use the following steps:

In Partner Center, select Customers and then locate the customer you want to manage.

Select the down arrow at the end of the row to expand the customer's record and then select Microsoft Azure Management Portal.

You're directed to the Azure portal where you can manage the customer's subscriptions.

At the Azure portal, select Subscriptions.

Select the subscription you want to assign and then select Access Control.

Select Add to add a user to the subscription.

After you add the user to the subscription, you can assign the user a role and the account to which the user will have access.
upvoted 4 times

AAsif098 8 months, 3 weeks ago

Agreed should be Azure AD

Answer is Azure Active Directory

Sign in to the Azure portal in the User Administrator role.

Navigate to Azure Active Directory > Users.

Select either Create new user or Invite external user from the menu. You can change this setting on the next screen.

See- <https://learn.microsoft.com/en-us/azure/active-directory/fundamentals/add-users-azure-active-directory>

next - At the Azure portal, select Subscriptions. Select the subscription you want to assign and then select Access Control. Select Add to add a user to the subscription.

upvoted 1 times

  **helpme1** 7 months, 1 week ago

I would go with Azure AD.

Azure subscriptions isn't a service to create a new user for an Azure subscription.

upvoted 1 times

  **tmusayev** 7 months, 3 weeks ago

Answer is Wrong. Correct answer is Azure AD

Azure Active Directory (AD) is the centralized identity and access management solution for Azure resources. To create a new user for an Azure subscription, you need to use Azure AD. You can create a new user by adding a new account to your Azure AD tenant and then assign the appropriate role to the user to manage resources within the Azure subscription. Once the user has the necessary permissions, they can log in to the Azure portal and manage resources within the subscription.

upvoted 2 times

  **azirila** 8 months ago

the question is create a subscription user not a aad user, so answer is correct read the question!

upvoted 2 times

  **zimzimzimma** 3 weeks, 1 day ago

You cannot CREATE a subscription user within subscriptions, only ADD existing users.The question states 'create a new user'. For creating new users you need Azure AD. So the answer is Azure AD.

upvoted 1 times

  **Ciupaz** 8 months ago

"new user for an Azure subscription" means that a subscription is already created, and you need to add a new user to it. So Azure Active Directory is the correct answer.

upvoted 2 times

  **Laaemea** 8 months, 1 week ago

I would go to AAD.

"a commitment to performance standards" is the the answer.

An Azure Service Level Agreement (SLA) is a formal agreement between Microsoft and a customer that defines the level of service and availability that Microsoft will provide for a specific Azure service.

The SLA typically includes metrics such as uptime, availability, and responsiveness, and specifies the guarantees that Microsoft will make in terms of meeting those metrics.

In more detail, an Azure SLA outlines the service level targets and credit system for Azure service, ensuring that customer will receive a credit towards their bill if they don't meet the agreed-upon service level. It guarantees a certain level of uptime (i.e. availability) for a given Azure service, and if that service falls below that level, customer may be eligible for a service credit to be applied to their account.

I would also say Tags due to my experience with with the first 400 questions. In a similar question "Configure Azure Cost Management budgets." was provided as answer and not just "budget" which is very unspecific. The keyword for me is "tracking" => tags. "usage and quotas" and "budget" is not possible to use for tracking!

upvoted 1 times
- helpme1

Highly Voted

7 months, 1 week ago

GPT: Budgets

While "usage and quotas" can help you monitor and control the resource usage for your Azure subscriptions, it is not the best option to track the costs of Azure resources. "Usage and quotas" only show the amount of resources being consumed, but do not provide information on how much they cost.

In contrast, "budgets" in Azure are a better option to track the costs of Azure resources, as they allow you to set up cost alerts based on your spending threshold, and provide detailed cost and usage reports. This helps you keep track of your spending on Azure resources and make informed decisions on cost optimization.

While tags can be useful in categorizing and organizing Azure resources, they are not specifically designed to track the costs of those resources. For tracking costs, budgets in Azure Cost Management and Billing is the appropriate solution. With budgets, you can set spending limits and receive alerts when spending reaches a certain threshold, allowing you to monitor and manage your costs more effectively.

2 weeks, 5 days ago

I would also say Tags due to my experience with with the first 400 questions. "budget" is very unspecific and not the right tool for tracking. The keyword for me is "tracking" => tags. "usage and quotas" and "budget" is not possible to use for tracking!

upvoted 1 times
- VenomX51

1 month ago

Answer is Budgets:

Usage and Quotas shows you how many resources you have (and can set limits on how many), but does not relate these resource counts to costs. Budgets does.

<https://learn.microsoft.com/en-us/azure/lab-services/how-to-determine-your-quota-usage>

upvoted 1 times

- Eagrob_11** 3 months, 2 weeks ago

The answer is D. To even use common sense, if you want to "Track" the usage, you use "Usage and quotas". It doesn't make sense to say the budget to use the track of the "service you use". So it's Usage and Quotas.

upvoted 1 times
- vitodobra** 4 months, 1 week ago

Selected Answer: D

The explication of "speedyweedy" are enough and clear.

upvoted 1 times
- speedyweedy** 4 months, 3 weeks ago

Selected Answer: D

D is correct
Usage and quotas allow you to monitor and control resource usage, and prevent unexpected charges. You can set quotas on resources to limit the amount of usage, and use Azure Monitor to track usage and performance metrics. This helps you identify inefficiencies and optimize your resource usage to save costs.Tags allow you to categorize Azure resources and add metadata to them, which makes it easier to track and manage costs. You can use tags to organize resources by department, project, environment, or any other category that makes sense for your organization. Once you have tagged your resources, you can use the Azure Cost Management and Billing tool to analyze costs by tag and get a better understanding of where your money is going.Budgets allow you to set spending limits and get alerts when you are approaching or exceeding those limits. You can set budgets at the subscription, resource group, or resource level, and receive email notifications when spending reaches a certain threshold. Budgets help you stay on top of costs and avoid unexpected charges.

upvoted 6 times
- ClaGar** 4 months, 3 weeks ago

ChatGPT still in its infancy. Learning Curve still to be climbed...Less lazy people would go right in Microsoft docs and make proper assesment of their own findings

upvoted 4 times
- Sa_Msa** 5 months, 3 weeks ago

Selected Answer: C

Both budgets and tags can be used to track costs in Azure. You can use budgets to track costs and usage throughout a billing period and alert you when costs or usage exceed thresholds that you set. You can also use budgets to track spending trends over time and forecast future spending. On the other hand, you can use tags to categorize resources and resource groups to help you organize resources and manage costs. You can apply tags to resources and resource groups to track costs by category.

Both seem correct, but budget seems to be more accurate in this case.

Budgets should be the right answer.

upvoted 1 times
- Thegracie** 6 months, 1 week ago

If you're using chat GPT, you have to be careful. after disagreeing with its results as C. budgets. it responded with this.
I apologize for the confusion earlier. You are correct that the most appropriate answer to the question "What should you use to track the costs of Azure resources?" is D. usage and quotas.

Usage and quotas allow you to monitor and track the usage of Azure resources in your subscription, and can help you identify potential cost savings or optimize resource usage. You can view usage and quota information through the Azure portal or through Azure management APIs.

upvoted 2 times
- BeauChateau** 6 months, 1 week ago

Selected Answer: C

C. budgets

To track the costs of Azure resources, you should use budgets. Azure budgets allow you to set thresholds on Azure costs and usage, which can help you to stay within your budget and avoid unexpected charges. You can set up email alerts or use webhook notifications to receive alerts when your budget thresholds are exceeded.

While tags can be useful for organizing and categorizing your resources, they do not provide direct cost tracking. Usage and quotas can provide information on how much you have consumed of a particular service or resource, but they do not provide cost information. Azure Quickstart templates are used for deployment and automation of Azure resources, and do not provide cost tracking or management.

Resource groups
Management groups
Azure policies
Azure App Service plans

provide organizations with the ability to manage the compliance of Azure resources across multiple subscriptions.

Correct Answer:

Azure policies

▼

 provide organizations with the ability to manage the compliance of Azure resources across multiple subscriptions.

- zelck

Highly Voted

8 months, 3 weeks ago

"Management Groups" is the answer.

https://learn.microsoft.com/en-us/azure/governance/management-groups/overview

If your organization has many Azure subscriptions, you may need a way to efficiently manage access, policies, and compliance for those subscriptions. Management groups provide a governance scope above subscriptions. You organize subscriptions into management groups; the governance conditions you apply cascade by inheritance to all associated subscriptions.

upvoted 20 times
- zelck

8 months, 2 weeks ago

https://learn.microsoft.com/en-us/training/modules/describe-core-architectural-components-of-azure/6-describe-azure-management-infrastructure

If you have many subscriptions, you might need a way to efficiently manage access, policies, and compliance for those subscriptions. Azure management groups provide a level of scope above subscriptions. You organize subscriptions into containers called management groups and apply governance conditions to the management groups. All subscriptions within a management group automatically inherit the conditions applied to the management group, the same way that resource groups inherit settings from subscriptions and resources inherit from resource groups. Management groups give you enterprise-grade management at a large scale, no matter what type of subscriptions you might have. Management groups can be nested.

upvoted 1 times
- speedyweedy

Highly Voted

4 months, 3 weeks ago

Management Groups
To manage the compliance of Azure resources across multiple subscriptions, the better option is management groups. Management groups provide a hierarchical structure that allows you to organize subscriptions and apply governance controls across multiple subscriptions at once. With management groups, you can apply policies, access controls, and other governance settings to all subscriptions within a management group. This allows you to manage compliance and enforce standards consistently across your organization. Azure policies, on the other hand, are used to enforce rules and regulations for resources within a single subscription. While policies are useful for enforcing compliance within a single subscription, they do not provide the ability to manage compliance across multiple subscriptions. Therefore, if you need to manage compliance of Azure resources across multiple subscriptions, management groups are the better option.

Azure Policy helps to enforce organizational standards and to assess compliance at-scale. Through its compliance dashboard, it provides an aggregated view to evaluate the overall state of the environment, with the ability to drill down to the per-resource, per-policy granularity. It also helps to bring your resources to compliance through bulk remediation for existing resources and automatic remediation for new resources.

  **zellick** 8 months, 2 weeks ago

There are several factors that can affect the costs of a resource in Azure. Here are three factors that you should consider when trying to identify which factors are affecting the costs of a resource:

The volume of outbound data: The volume of data that is transferred out of Azure can affect the costs of a resource. For example, if you have a resource that generates a large volume of outbound data, such as a web server that serves a lot of content to users, this can result in higher costs.

The service tier: The service tier that you choose for a resource can also affect its costs. For example, if you choose a higher service tier, such as a more powerful virtual machine, this can result in higher costs.

The Azure region: The Azure region in which a resource is deployed can also affect its costs. Azure regions are geographical areas that contain one or more data centers, and the costs of resources can vary depending on the region in which they are deployed.

upvoted 2 times
- BeauChateau

6 months, 1 week ago

Selected Answer: C

C. tags

To identify which department is responsible for the cost of each resource in an Azure subscription, you can use tags. Tags are name-value pairs that enable you to categorize resources in a way that is meaningful to your organization. You can use tags to identify resources that belong to a specific department or project, for example.

Once you have tagged your resources with the appropriate department or project information, you can use the Azure Cost Management + Billing service to generate reports and analyze costs by department or project. This can help you identify areas where you may be able to reduce costs or optimize your resource usage.

Budgets and alerts can also be useful tools for monitoring and managing costs in an Azure subscription, but they are not specifically designed for identifying which department is responsible for the cost of each resource.

Select the answer that correctly completes the sentence.

Answer Area

You have an Azure virtual network named VNET1 in a resource group named RG1.

You assign the Azure Policy definition of Not Allowed Resource Type and specify that virtual networks are not an allowed resource type in RG1. VNET1

- is deleted automatically.
- is moved automatically to another resource group.
- continues to function normally.
- is now a read-only object.

Answer Area

You have an Azure virtual network named VNET1 in a resource group named RG1.

You assign the Azure Policy definition of Not Allowed Resource Type and specify that virtual networks are not an allowed resource type in RG1. VNET1

Correct Answer:

- is deleted automatically.
- is moved automatically to another resource group.
- continues to function normally.
- is now a read-only object.

 **Zenittsu** Highly Voted 3 months, 3 weeks ago

Chat GPT says: Continue to Function normally

The policy will evaluate the resources within the resource group and flag VNET1 as noncompliant since it violates the policy's rule. However, the policy itself does not take any action to delete or modify existing resources.

The purpose of the policy is to enforce compliance and prevent the creation of new virtual networks of the disallowed type within RG1. Existing resources will generally continue to function normally unless there are additional actions defined in the policy's policy definition to explicitly modify or delete them.

It is important to note that Azure policies primarily focus on preventing noncompliant resources from being created or deployed, rather than automatically modifying or deleting existing resources.

Azure Advisor provides personalized recommendations to help optimize your Azure resources and improve the performance, security, and reliability of your workloads.

The recommendations provided by Azure Advisor are personalized to your specific usage patterns and resource configurations, taking into account factors such as the size and complexity of your environment, your usage patterns, and your business goals. This ensures that the recommendations are relevant and actionable, and can help you improve the efficiency and effectiveness of your Azure deployments.

Some examples of the recommendations provided by Azure Advisor include optimizing virtual machine sizes to reduce costs, enabling security features such as Azure Security Center, improving network performance by optimizing network security groups, and reducing downtime by setting up automated backups.

To restrict VM sizes with Azure Policy, you can create a policy definition that specifies the allowed VM sizes. You can then assign this policy definition to your Azure subscription or resource group. This policy definition denies the deployment of VMs that are not of the allowed sizes.

So I think N N Y is the answer.
upvoted 1 times
- Vibhu123

2 months, 1 week ago

By referring this this paragraph, i see It's Y for A.....Assign the definition to resources
To implement your policy definitions, you assign definitions to resources. A policy assignment is a policy definition that takes place within a specific scope. This scope could be a management group (a collection of multiple subscriptions), a single subscription, or a resource group.
upvoted 1 times
- Vibhu123

2 months, 1 week ago

I misread i think, it should be NO as per this paragraph...i couldn't find Y for this question
upvoted 1 times
- MrOkay

2 months, 1 week ago

1 is No,
you cannot assign a policy definition to a single resource, such as a VM. You can only assign a policy definition to a management group, subscription, or resource group.
upvoted 1 times
- rteinformatica

2 months, 1 week ago

The A is not correct. Policies are assigned to Management Groups, Subscriptions, or Resource Groups. Nothing else...

Azure Arc can manage Azure Kubernetes Service (AKS) clusters at scale.	☒	☐
Azure Arc can manage a third-party database solution hosted outside of Azure.	☐	☒

- wiper

1 month ago

But there is a statement :
Manage virtual machines, Kubernetes clusters, and databases as if they are running in Azure.
As stays in this doc: <https://learn.microsoft.com/en-us/azure/azure-arc/overview#:~:text=Manage%20virtual%20machines%2C%20Kubernetes%20clusters%2C%20and%20databases%20as%20if%20they%20are%20running%20in%20Azure.>
so maybe there is 3x Y
upvoted 1 times
- DimsumDestroyer

1 month, 2 weeks ago

Kind of confused about this one, what does it mean when it says third party? Is the third party bit referring to the SQL software being used or the cloud provider hosting? The documentation says it supports database management, but it seems this is only supporting two specific types of "data services" (SQL managed instance and PostgreSQL), so I would probably go with YYN to take the answer with the least assumption.

<https://learn.microsoft.com/en-us/azure/azure-arc/data/overview>
upvoted 1 times
